This paper consists of main two sections. In the first section, we prove a common fixed point theorem in modified intuitionistic fuzzy metric space by combining the ideas of pointwise \( R \)-weak commutativity and reciprocal continuity of mappings satisfying contractive conditions. In the second section, we prove common fixed point theorems in modified intuitionistic fuzzy metric space from the class of compatible continuous mappings to noncompatible and discontinuous mappings. Lastly, as an application, we prove fixed point theorems using weakly reciprocally continuous noncompatible self-mappings on modified intuitionistic fuzzy metric space satisfying some implicit relations.

1. Introduction and Preliminaries

Recently, Saadati et al. [1] introduced the modified intuitionistic fuzzy metric space and proved some fixed point theorems for compatible and weakly compatible maps. Consequently, in this modified setting of intuitionistic fuzzy metric space, Jain et al. [2] discussed the notion of the compatibility of type \((P)\); Sedghi et al. [3] proved some common fixed point theorems for weakly compatible maps using contractive conditions of integral type. The paper [1] is the inspiration of a large number of papers [4–7] that employ the use of modified intuitionistic fuzzy metric space and its applications.

In this paper, we prove some new common fixed point theorems in modified intuitionistic fuzzy metric spaces. While proving our results, we utilize the idea of compatibility due to Jungck [8] together with weakly reciprocal continuity due to Pant et al. [16]. Consequently, our results improve and sharpen many known common fixed point theorems available in the existing literature of modified intuitionistic fuzzy fixed point theory.

Firstly, we recall the following notions that will be used in the sequel.

Lemma 1 (see [10]). Consider the set \( L^* \) and the operation \( \leq_{L^*} \) defined by

\[
L^* = \left\{ (x_1, x_2) : (x_1, x_2) \in [0, 1]^2, x_1 + x_2 \leq 1 \right\}
\]

\[
(x_1, x_2) \leq_{L^*} (y_1, y_2) \iff x_1 \leq y_1, x_2 \geq y_2,
\]

for every \((x_1, x_2), (y_1, y_2) \in L^*\). Then, \((L^*, \leq_{L^*})\) is a complete lattice.

One denotes its units by \(0_{L^*} = (0, 1)\) and \(1_{L^*} = (1, 0)\).

Definition 2 (see [11]). A triangular norm \((t\)-norm\) on \(L^*\) is a mapping \( F : (L^*)^2 \to L^* \) satisfying the following conditions:

1. \( F(x, 1_{L^*}) = x \) for all \( x \) in \( L^* \),
2. \( F(x, y) = F(y, x) \) for all \( x, y \) in \( L^* \),
3. \( F(x, F(y, z)) = F(F(x, y), z) \) for all \( x, y, z \) in \( L^* \),
4. if for all \( x, x', y, y' \) in \( L^* \), \( x \leq_{L^*} x' \) and \( y \leq_{L^*} y' \) imply \( F(x, y) \leq_{L^*} F(x', y') \).

Definition 3 (see [10, 11]). A continuous \( t \)-norm \( F \) on \( L^* \) is called continuous \( t \)-representable if and only if there exist a
Definition 4 (see [1]). Let $M,N$ be fuzzy sets from $X^2 \times (0, +\infty) \rightarrow [0, 1]$ such that for all $x, y \in X$ and $t > 0$, the 3-tuple $(X, \zeta_{M,N}, \mathcal{F})$ is said to be a modified intuitionistic fuzzy metric space if an arbitrary nonempty set, $\mathcal{F}$ is a continuous $t$-representative, and $\zeta_{M,N}$ is a mapping $X^2 \times (0, +\infty) \rightarrow L^*$ satisfying the following conditions for every $x, y \in X$ and $t, s > 0$:

(a) $\zeta_{M,N}(x, y, t) > L_\ast \iff 0L_\ast$,

(b) $\zeta_{M,N}(x, y, t) = 1L_\ast$ if and only if $x = y$,

(c) $\zeta_{M,N}(x, y, t) = \zeta_{M,N}(y, x, t)$,

(d) $\zeta_{M,N}(x, y, t + s) \geq \mathcal{F}(\zeta_{M,N}(x, z, t), \zeta_{M,N}(z, y, s))$,

(e) $\zeta_{M,N}(x, y, \cdot) : (0, +\infty) \rightarrow L^*$ is continuous.

In this case, $\zeta_{M,N}$ is called a modified intuitionistic fuzzy metric. Here, $\zeta_{M,N}(x, y, t) = (M(x, y, t), N(x, y, t))$.

Definition 5 (see [12]). In a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$, $(M(x, y, \cdot), N(x, y, \cdot))$ is nondecreasing, and $N(x, y, \cdot)$ is nonincreasing for all $x, y \in X$. Hence, $\zeta_{M,N}(x, y, t)$ is nondecreasing with respect to $t$ for all $x, y \in X$.

Definition 6 (see [1]). A sequence $\{x_n\}$ in a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ is called a Cauchy sequence if for each $\epsilon > 0$ and $t > 0$, there exists $n_0 \in \mathbb{N}$ such that $\zeta_{M,N}(x_n, x_m, t) > L_\ast (1 - \epsilon, \epsilon)$ for all $n, m \geq n_0$ and for all $t$.

Definition 7 (see [1]). A sequence $\{x_n\}$ in a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ is said to be convergent to $x \in X$, denoted by $x_n \rightarrow x$ if $\lim_{n \rightarrow \infty} \zeta_{M,N}(x_n, x, t) = 1L_\ast$ for all $t$.

Definition 8 (see [1]). A modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ is said to be complete if and only if every Cauchy sequence is convergent to a point of it.

Definition 9 (see [1, 13]). A pair of self-mappings $(f, g)$ of modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ is said to be compatible if $\lim_{n \rightarrow \infty} \zeta_{M,N}(fgx_n, gfx_n, t) = 1L_\ast$, whenever $\{x_n\}$ is a sequence in $X$ such that $\lim_{n \rightarrow \infty} f(x_n) = \lim_{n \rightarrow \infty} g(x_n) = z$ for some $z \in X$.

Definition 10 (see [13]). Two self-mappings $f$ and $g$ are called noncompatible if there exists at least one sequence $\{x_n\}$ such that $\lim_{n \rightarrow \infty} f(x_n) = \lim_{n \rightarrow \infty} g(x_n) = z$ for some $z$ in $X$ but either $\lim_{n \rightarrow \infty} \zeta_{M,N}(fgx_n, gfx_n, t) \neq 1L_\ast$ or the limit does not exist for all $z$ in $X$.

Definition 11 (see [14, 15]). A pair of self mappings $(f, g)$ of a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ is said to be $R$-weakly commuting at a point $x$ in $X$ if $\zeta_{M,N}(fgx_n, gfx_n, t) \geq L_\ast \zeta_{M,N}(fx_n, gx_n, t/R)$ for some $R > 0$.

Definition 12 (see [14, 15]). The two self-maps $f$ and $g$ of a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ are called pointwise $R$-weakly commuting on $X$ if for all $x \in X$, there exists $R > 0$ such that $\zeta_{M,N}(fgx, gfx, t) \geq L_\ast \zeta_{M,N}(fx, gx, t/R)$.

Definition 13 (see [15]). The two self-maps $f$ and $g$ of a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ are called $R$-weakly commuting of type $(A_f)$ if there exists some $R > 0$ such that $\zeta_{M,N}(fgx, gfx, t) \geq L_\ast \zeta_{M,N}(fx, gx, t/R)$ for all $x \in X$.

Definition 14 (see [2]). Two self-mappings $f$ and $g$ of a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ are called $R$-weakly commuting of type $(P)$ if there exists some $R > 0$ such that $\zeta_{M,N}(fgx, gfx, t) \geq L_\ast \zeta_{M,N}(fx, gx, t/R)$ for all $x \in X$.

Remark 5 (see [12]). In a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$, $(M(x, y, \cdot), N(x, y, \cdot))$ is nondecreasing, and $N(x, y, \cdot)$ is nonincreasing for all $x, y \in X$. Hence, $\zeta_{M,N}(x, y, t)$ is nondecreasing with respect to $t$ for all $x, y \in X$.
Lemma 17 (see [2]). Let \((X, \xi_{M,N}, T)\) be a modified intuitionistic fuzzy metric space and for all \(x, y \in X, t > 0\) and if for a number \(k \in (0, 1),\)
\[
\xi_{M,N}(x, y, kt) \geq_L \xi_{M,N}(x, y, t).
\]
Then \(x = y.\)

Lemma 18 (see [2]). Let \((X, \xi_{M,N}, T)\) be a modified intuitionistic fuzzy metric space and \(\{y_n\}\) a sequence in \(X.\) If there exist a number \(k \in (0, 1)\) such that
\[
\xi_{M,N}(y_n, y_{n+1}, kt) \geq_L \xi_{M,N}(y_{n-1}, y_n, t) \quad \forall t > 0, n = 1, 2, 3, \ldots,
\]
then \(\{y_n\}\) is a Cauchy sequence in \(X.\)

3. Main Results

3.1. Section I: Pointwise R-weakly Commuting Pairs and Fixed Point

Lemma 19. Let \((X, \xi_{M,N}, T)\) be a modified intuitionistic fuzzy metric space, and let \((A, S)\) and \((B, T)\) be pairs of self-mappings on \(X\) satisfying
\[
A(X) \subseteq T(X), \quad B(X) \subseteq S(X),
\]
there exists a constant \(k \in (0, 1)\) such that
\[
\xi_{M,N}(Ax, By, kt) \geq_L \min \{\xi_{M,N}(Ty, By, t), \xi_{M,N}(Sx, Ax, t), \xi_{M,N}(TY, Ax, (2-\alpha) t), \xi_{M,N}(Ty, Sx, t)\}
\]
for all \(x, y \in X, t > 0\) and \(\alpha \in (0, 2).\) Then, the continuity of one of the mappings in compatible pair \((A, S)\) or \((B, T)\) on \((X, \xi_{M,N}, T)\) implies their reciprocal continuity.

Proof. First, assume that \(A\) and \(S\) are compatible and \(S\) is continuous. We show that \(A\) and \(S\) are reciprocally continuous. Let \(\{u_n\}\) be a sequence such that \(Au_n \to z\) and \(Su_n \to z\) for some \(z\) in \(X\) as \(n \to \infty.\) Since \(S\) is continuous, we have \(SAu_n \to Sz\) and \(SSu_n \to Sz\) as \(n \to \infty\) and since \((A, S)\) is compatible, we have for all \(t > 0,\)
\[
\lim_{n \to \infty} \xi_{M,N}(Au_n, Su_n, t) = 1_L, \quad \lim_{n \to \infty} \xi_{M,N}(Au_n, Sz, t) = 1_L.
\]
That is, \(ASu_n \to Sz\) as \(n \to \infty.\) By (4), for each \(n,\) there exists \(v_n\) in \(X\) such that \(ASu_n = Tv_n.\) Thus, we have \(SSu_n \to Sz, SAu_n \to Sz, ASu_n \to Sz,\) and \(Tv_n \to Sz\) as \(n \to \infty\) whenever \(ASu_n = Tv_n.\)

Now, we claim that \(Bu_n \to Sz\) as \(n \to \infty.\) Suppose not, then, by (5), taking \(\alpha = 1,\)
\[
\xi_{M,N}(ASu_n, Bu_n, kt) \geq_L \min \{\xi_{M,N}(Tv_n, Bu_n, t), \xi_{M,N}(SSu_n, ASu_n, t), \xi_{M,N}(SSu_n, Bu_n, t), \xi_{M,N}(Tv_n, SSu_n, t), \xi_{M,N}(Tv_n, SSu_n, t)\}.
\]
Taking \(n \to \infty,\) we have
\[
\xi_{M,N}(Sz, \lim_{n \to \infty} Bu_n, kt)
\]
\[
\geq_L \min \{\xi_{M,N}(Sz, \lim_{n \to \infty} Bu_n, t), \xi_{M,N}(Sz, Sz, t), \xi_{M,N}(Sz, \lim_{n \to \infty} Bu_n, t), \xi_{M,N}(Sz, Sz, t)\}
\]
\[
= \min \{\xi_{M,N}(Sz, \lim_{n \to \infty} Bu_n, t), 1_L, 1_L, 1_L\}
\]
\[
= \xi_{M,N}(Sz, \lim_{n \to \infty} Bu_n, t).
\]
By Lemma 17, we have \(\lim_{n \to \infty} Bu_n = Sz.\)

Claim that \(Az = Sz.\) Again, by (5), taking \(\alpha = 1,\)
\[
\xi_{M,N}(Az, Bu_n, kt) \geq_L \min \{\xi_{M,N}(Tv_n, Bu_n, t), \xi_{M,N}(Sz, Az, t), \xi_{M,N}(Sz, Bu_n, t), \xi_{M,N}(Tv_n, Az, t), \xi_{M,N}(Tv_n, Sz, t)\}
\]
Taking \(n \to \infty,\) we get
\[
\xi_{M,N}(Az, Sz, kt) \geq_L \min \{\xi_{M,N}(Sz, Sz, t), \xi_{M,N}(Sz, Az, t), \xi_{M,N}(Sz, Sz, t), \xi_{M,N}(Sz, Az, t), \xi_{M,N}(Sz, Sz, t)\}
\]
\[
= \min \{1_L, \xi_{M,N}(Sz, Az, t), 1_L, \xi_{M,N}(Sz, Sz, t)\}
\]
\[
= \xi_{M,N}(Sz, Az, t).
\]
By Lemma 17, \(Az = Sz.\)
Therefore, $SA_{n} \to Sz, AS_{n} \to Sz = Az$ as $n \to \infty$.

Hence, $A$ and $S$ are reciprocally continuous on $X$. If the pair $(B, T)$ is assumed to be compatible and $T$ is continuous, the proof is similar.

**Theorem 20.** Let $(X, \zeta_{M,N}, T)$ be a complete modified intuitionistic fuzzy metric space. Further, let $(A, S)$ and $(B, T)$ be pointwise $R$-weakly commuting pairs of self-mappings of $X$ satisfying (4), (5). If one of the mappings in compatible pair $(A, S)$ or $(B, T)$ is continuous, then $A, B, S,$ and $T$ have a unique common fixed point in $X$.

**Proof.** Let $x_{0} \in X$. By (4), we define the sequences $\{x_{n}\}$ and $\{y_{n}\}$ in $X$ such that for all $n = 0, 1, 2, \ldots$,

$$
y_{2n} = Ax_{2n} = Tx_{2n+1}, \
y_{2n+1} = Bx_{2n+1} = Sx_{2n+2}.
$$

We show that $\{y_{n}\}$ is a Cauchy sequence in $X$. By (5) taking $\alpha = 1 - \beta, \beta \in (0, 1)$, we have

$$
\zeta_{M,N}(y_{2n+1}, y_{2n+2}, kt) \\
= \zeta_{M,N}(Bx_{2n+1}, Ax_{2n+2}, kt) \\
= \zeta_{M,N}(Ax_{2n+2}, Bx_{2n+1}, kt) \\
\geq L^{-1} \min \{\zeta_{M,N}(T(x_{2n+1}), Bx_{2n+1}, t), \zeta_{M,N}(Sx_{2n+2}, Ax_{2n+2}, t), \zeta_{M,N}(Sx_{2n+2}, Bx_{2n+1}, 1 - \beta t), \zeta_{M,N}(T(x_{2n+1}), Ax_{2n+2}, 1 + \beta t), \zeta_{M,N}(T(x_{2n+1}), Sx_{2n+2}, t)\} \\
= \min \{\zeta_{M,N}(y_{2n}, y_{2n+1}, t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, 1 - \beta t), \zeta_{M,N}(y_{2n}, y_{2n+2}, 1 + \beta t), \zeta_{M,N}(y_{2n}, y_{2n+1}, t)\} \\
\geq L^{-1} \min \{\zeta_{M,N}(y_{2n}, y_{2n+1}, t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, t), \zeta_{M,N}(y_{2n}, y_{2n+1}, 1 - \beta t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, 1 + \beta t), \zeta_{M,N}(y_{2n}, y_{2n+1}, t)\} \\
\geq L^{-1} \min \{\zeta_{M,N}(y_{2n}, y_{2n+1}, t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, t), \zeta_{M,N}(y_{2n}, y_{2n+1}, 1 - \beta t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, 1 + \beta t), \zeta_{M,N}(y_{2n}, y_{2n+1}, t)\}.
$$

Taking $\beta \to 1$, we have

$$
\zeta_{M,N}(y_{2n+1}, y_{2n+2}, kt) \\
\geq L^{-1} \min \{\zeta_{M,N}(y_{2n}, y_{2n+1}, t), \zeta_{M,N}(y_{2n}, y_{2n+1}, 1 - \beta t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, 1 + \beta t), \zeta_{M,N}(y_{2n}, y_{2n+1}, t)\} \\
\geq L^{-1} \min \{\zeta_{M,N}(y_{2n}, y_{2n+1}, t), \zeta_{M,N}(y_{2n+1}, y_{2n+2}, t)\}.
$$

Similarly,

$$
\zeta_{M,N}(y_{2n}, y_{2n+1}, t) \geq L^{-1} \zeta_{M,N}(y_{2n+1}, y_{2n+2}, t).
$$

Therefore, for any $n$ and $t$, we have

$$
\zeta_{M,N}(y_{n}, y_{n+1}, t) \geq L^{-1} \zeta_{M,N}(y_{n+1}, y_{n+2}, t).
$$

Hence, by Lemma 18, $\{y_{n}\}$ is a Cauchy sequence in $X$. Since $X$ is complete, $\{y_{n}\}$ converges to $z$ in $X$. Its subsequences $\{Ax_{2n}\}, \{Tx_{2n+1}\}, \{Bx_{2n+1}\}, \{Sx_{2n+2}\}$ also converge to $z$.

Now, suppose that $(A, S)$ is a compatible pair and $S$ is continuous. Then, by Lemma 17, $A$ and $S$ are reciprocally continuous, then $SA_{n} \to Sz, AS_{n} \to Az$ as $n \to \infty$. As, $(A, S)$, is a compatible pair. This implies that

$$
\lim_{n \to \infty} \zeta_{M,N}(SA_{n}, SA_{n}, t) = 1_L^{-1}, \\
\zeta_{M,N}(Az, Sz, t) = 1_L^{-1}.
$$

Hence, $Az = Sz$.

Since $A(X) \subseteq T(X)$, there exists a point $p$ in $X$ such that $Az =Tp = Sz$.

By (5), taking $\alpha = 1$,

$$
\zeta_{M,N}(Az, Bp, kt) \\
\geq L^{-1} \min \{\zeta_{M,N}(Tp, Bp, t), \zeta_{M,N}(Sz, Az, t), \zeta_{M,N}(Sz, Bp, t), \zeta_{M,N}(Tp, Az, t), \zeta_{M,N}(Tp, Sz, t)\}.
$$

Thus, by Lemma 17, we have $Az = Bp$.

Thus, $Az = Bp = Sz = Tp$. 

Since $A$ and $S$ are pointwise $R$-weakly commuting mappings, there exists $R > 0$, such that
\[
\zeta_{M,N}(ASz, SAz, t) \geq L, \quad \zeta_{M,N}(Az, Sz, t) = 1, \tag{18}
\]
Therefore, $ASz = SAz$ and $AAz = ASz = SAz = SSz$.

Similarly, since $B$ and $T$ are pointwise $R$-weakly commuting mappings, we have $BBp = BTp = T^2p = Tp$.

Again, by (5), taking $\alpha = 1$,
\[
\zeta_{M,N}(AAz, Bp, kt) \geq L, \quad \min \{\zeta_{M,N}(Tp, Bp, t), \zeta_{M,N}(SAz, AAz, t), \zeta_{M,N}(AAz, Az, t), \zeta_{M,N}(TP, AAz, t), \zeta_{M,N}(TP, SAz, t)\}, \tag{19}
\]
\[
\zeta_{M,N}(AAz, Az, kt) \geq L, \quad \min \{\zeta_{M,N}(Tp, Tp, t), \zeta_{M,N}(AAz, AAz, t), \zeta_{M,N}(Az, AAz, t), \zeta_{M,N}(AAz, Az, t)\}, \tag{20}
\]
By Lemma 17, we have $AAz = AZ = SAz$. Hence $Az$ is a common fixed point of $A$ and $S$. Similarly, by (5), $Bp = Az$ is a common fixed point of $B$ and $T$. Hence, $Az$ is a common fixed point of $A, B, S,$ and $T$.

For Uniqueness. Suppose that $Ap(\neq Az)$ is another common fixed point of $A, B, S,$ and $T$. Then, by (5), taking $\alpha = 1$,
\[
\zeta_{M,N}(AAz, BAp, kt) \geq L, \quad \min \{\zeta_{M,N}(TAp, BAp, t), \zeta_{M,N}(SAz, AAz, t), \zeta_{M,N}(AAz, Az, t), \zeta_{M,N}(TAp, AAz, t), M(T, AAz, t)\}, \tag{21}
\]
\[
\zeta_{M,N}(Az, Ap, kt) \geq L, \quad \min \{\zeta_{M,N}(Ap, Ap, t), \zeta_{M,N}(Az, Az, t), \zeta_{M,N}(Az, Ap, t), \zeta_{M,N}(Ap, Az, t)\}, \tag{22}
\]
\[
\zeta_{M,N}(Az, Ap, kt) \geq L, \quad \zeta_{M,N}(Az, Ap, kt), \tag{23}
\]
By Lemma 17, $Az = Ap$.

Thus, the uniqueness follows.

**Corollary 21.** Let $(X, \zeta_{M,N}, \mathcal{F})$ be a complete modified intuitionistic fuzzy metric space. Further, let $A$ and $B$ be reciprocally continuous mappings on $X$ satisfying
\[
\zeta_{M,N}(Ax, By, kt) \geq L, \quad \min \{\zeta_{M,N}(y, By, t), \zeta_{M,N}(x, Ax, t), \zeta_{M,N}(y, Ax, (2-\alpha) t), \zeta_{M,N}(y, y, t)\} \tag{24}
\]
for all $x, y \in X, t > 0$ and $\alpha \in (0, 2)$, then pair $A$ and $B$ has a unique common fixed point.

**Example 22.** Let $X = [2, 20]$ and for each $t > 0$, define
\[
\zeta_{M,N}(x, y, t) = \begin{pmatrix} \frac{t}{t+|x-y|} \end{pmatrix}. \tag{25}
\]
Then, $(X, \zeta_{M,N}, \mathcal{F})$ is complete modified intuitionistic fuzzy metric space. Let $A, B, S$, and $T$ be self-mappings of $X$ defined as
\[
A(2) = 2, \quad Au = 3 \quad \text{if } u > 2,
\]
\[
B(u) = 2 \quad \text{if } 2 < u \leq 5, \quad Bu = 6 \quad \text{if } 2 < u \leq 5,
\]
\[
S(2) = 2, \quad Su = 6 \quad \text{if } u > 2,
\]
\[
T(2) = 2, \quad Tu = 12 \quad \text{if } 2 < u \leq 5,
\]
\[
T(u) = u - 3 \quad \text{if } u > 5. \tag{26}
\]

Then, $A, B, S$, and $T$ satisfy all the conditions of the above theorem with $k \in (0, 1)$ and have a unique common fixed point $u = 2$.

3.2. Section II: Weak Reciprocal Continuity and Fixed Point Theorem

**Theorem 23.** Let $f$ and $g$ be weakly reciprocally continuous self-mappings of a complete modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ satisfying the following conditions:
\[
f(X) \subset g(X) \tag{27}
\]
for any $x, y \in X, t > 0, k \in (0, 1)$ such that
\[
\zeta_{M,N}(fx, fy, kt) \geq L, \quad \min \{\zeta_{M,N}(gx, gy, t), \zeta_{M,N}(gx, fy, 2t), \zeta_{M,N}(fx, gx, t), \zeta_{M,N}(fy, gy, t)\}. \tag{28}
\]
If $f$ and $g$ are either compatible or $R$-weakly commuting of type $(A_g)$ or $R$-weakly commuting of type $(A_f)$ or $R$-weakly commuting of type $(P)$, then $f$ and $g$ have a unique common fixed point.
Proof. Let $x_0$ be any point in $X$. Then, as $f(X) \subset g(X)$, there exist a sequence of points $\{x_n\}$ such that $f(x_n) = g(x_{n+1})$.

Also, define a sequence $\{y_n\}$ in $X$ as

$$y_n = f(x_n) = g(x_{n+1}).$$ (26)

Now, we show that $\{y_n\}$ is a Cauchy sequence in $X$. For proving this, by (25), we have

$$\zeta_{M,N}(y_n, y_{n+1}, t) = \zeta_{M,N}(f x_n, f x_{n+1}, t) \geq L \cdot \min \{\zeta_{M,N}(g x_n, g x_{n+1}, 2t), \zeta_{M,N}(f x_n, g x_{n+1}, t), \zeta_{M,N}(f x_n, f x_{n+1}, t)\}$$

$$= \min \{\zeta_{M,N}(y_{n-1}, y_n, t), \zeta_{M,N}(y_{n-1}, y_{n+1}, 2t), \zeta_{M,N}(y_n, y_{n+1}, t)\}.$$ (27)

Hence, $\lim_{n \to \infty} g f(x_n) = g z$. By (26), we get $\lim_{n \to \infty} f g(x_{n+1}) = \lim_{n \to \infty} f f(x_n) = g z$.

Therefore, by (25), we get

$$\zeta_{M,N}(f z, f f x_n, t) \geq L \cdot \min \{\zeta_{M,N}(g z, g f x_n, t), \zeta_{M,N}(g z, f f x_n, 2t), \zeta_{M,N}(f z, g z, t), \zeta_{M,N}(f z, g f x_n, t), \zeta_{M,N}(f f x_n, g f x_n, t)\}.$$ (30)

Taking $n \to \infty$, we get

$$\zeta_{M,N}(f z, g z, t) \geq L \cdot \zeta_{M,N}(f z, g z, t).$$ (31)

Hence, by Lemma 17, we get $f z = g z$. Again, the compatibility of $f$ and $g$ implies the commutativity at a coincidence point. Hence $g f z = f g z = f f z = g g z$. Using (25), we obtain

$$\zeta_{M,N}(f z, f f z, t) \geq L \cdot \min \{\zeta_{M,N}(g z, f f z, t), \zeta_{M,N}(f z, f f z, 2t), \zeta_{M,N}(f z, g z, t), \zeta_{M,N}(f z, g f z, t)\}$$

$$= \min \{\zeta_{M,N}(f z, f f z, t), \zeta_{M,N}(f z, f f z, 2t), 1_L, \zeta_{M,N}(f z, g z, t), \zeta_{M,N}(f z, g f z, t)\}.$$ (32)

That is, $f z = f f z$. Hence, $f z = f f z = g f z$ and $f z$ is a common fixed point of $f$ and $g$.

Next, suppose that $\lim_{n \to \infty} g f(x_n) = f z$. Then, $f(X) \subset g(X)$ implies that $f z = g u$ for some $u \in X$ and, therefore, $\lim_{n \to \infty} g f(x_n) = g u$.

The compatibility of $f$ and $g$ implies that $\lim_{n \to \infty} g f(x_n) = g u$. By the virtue of (26), this gives

$$\lim_{n \to \infty} f g(x_{n+1}) = \lim_{n \to \infty} f f(x_n) = g u.$$ (33)
Using (25), we get
\[ \zeta_{M,N}(fu, ffx_n, kt) \geq_L \min \{ \zeta_{M,N}(gu, gfx_n, t), \zeta_{M,N}(gu, ffx_n, 2t), \zeta_{M,N}(fu, gu, t), \zeta_{M,N}(fu, gfu, t), \zeta_{M,N}(ffx_n, gffx_n, t) \}. \] (34)

Taking \( n \to \infty \), we have
\[ \zeta_{M,N}(fu, gu, kt) \geq L \cdot \min \{ \zeta_{M,N}(gu, gu, t), \zeta_{M,N}(gu, ffu, 2t), \zeta_{M,N}(fu, gu, t), \zeta_{M,N}(fu, gfu, t), \zeta_{M,N}(ffx_n, gffx_n, t) \} \geq \zeta_{M,N}(fu, fu, kt). \] (35)

That is, \( fu = fffu \). Hence \( fu = fffu = gfu \) and \( fu \) is a common fixed point of \( f \) and \( g \).

Now, suppose that \( f \) and \( g \) are \( R \)-weakly commuting of type (\( A_g \)). Now, weak reciprocal continuity of \( f \) and \( g \) implies that \( \lim_{n \to \infty} fg(x_n) = f(z) \) or \( \lim_{n \to \infty} gf(x_n) = g(z) \). Let us first assume that \( \lim_{n \to \infty} gf(x_n) = g(z) \). Then, \( R \)-weak commutativity of type (\( A_g \)) of \( f \) and \( g \) yields
\[ \zeta_{M,N}(ffx_n, gffx_n, t) \geq L \cdot \zeta_{M,N}(fx_n, g(x_n, t), \zeta_{M,N}(fx_n, g(x_n, t), \zeta_{M,N}(fx_n, g(x_n, t))) \geq \zeta_{M,N}(ffx_n, gffx_n, t). \] (37)

This gives \( \lim_{n \to \infty} ffx_n = g(z) \). Also, using (25), we get
\[ \zeta_{M,N}(fx_n, gffx_n, t) \geq L \cdot \min \{ \zeta_{M,N}(gz, gffx_n, t), \zeta_{M,N}(gz, ffx_n, 2t), \zeta_{M,N}(fz, gz, t), \zeta_{M,N}(fz, gffx_n, t), \zeta_{M,N}(ffx_n, gffx_n, t) \}. \] (38)

Taking \( n \to \infty \), we have
\[ \zeta_{M,N}(fz, gz, kt) \geq L \cdot \min \{ \zeta_{M,N}(gz, gz, t), \zeta_{M,N}(gz, gffx_n, t), \zeta_{M,N}(fz, gz, t), \zeta_{M,N}(fz, gffx_n, t) \} \geq \zeta_{M,N}(fz, gz, kt). \] (39)

Hence, by Lemma 17, we get \( f(z) = g(z) \). Again, by using \( R \)-weak commutativity of type (\( A_g \)),
\[ \zeta_{M,N}(ffx_n, gffx_n, t) \geq L \cdot \zeta_{M,N}(fz, gz, t). \] (40)

This yields \( ffx_n = gffx_n \). Therefore, \( fffz = fggz \). Using (25), we get
\[ \zeta_{M,N}(ffx_n, gffx_n, t) \geq L \cdot \zeta_{M,N}(fz, g(z, t), \zeta_{M,N}(fz, g(z, t), \zeta_{M,N}(fz, g(z, t))) \geq \zeta_{M,N}(ffx_n, gffx_n, t). \] (41)

That is, \( f(z) = f(z) \). Hence, \( f(z) = f(z) \) and \( f(z) \) is a common fixed point of \( f \) and \( g \).

Similarly, we prove if \( \lim_{n \to \infty} fg(x_n) = f(z) \).

Suppose that \( f \) and \( g \) are \( R \)-weakly commuting of type (\( A_f \)). Again, as done above, we can easily prove that \( f(z) \) is a common fixed point of \( f \) and \( g \).

Finally, suppose that \( f \) and \( g \) are \( R \)-weakly commuting of type (\( P \)). Weak reciprocal continuity of \( f \) and \( g \) implies that \( \lim_{n \to \infty} fg(x_n) = f(z) \) or \( \lim_{n \to \infty} gf(x_n) = g(z) \). Let us assume that \( \lim_{n \to \infty} gf(x_n) = g(z) \). Then, \( R \)-weak commutativity of type (\( P \)) of \( f \) and \( g \) yields
\[ \zeta_{M,N}(ffx_n, gffx_n, t) \geq L \cdot \zeta_{M,N}(fx_n, g(x_n, t), \zeta_{M,N}(fx_n, g(x_n, t), \zeta_{M,N}(fx_n, g(x_n, t))) \geq \zeta_{M,N}(ffx_n, gffx_n, t). \] (42)

That gives \( \zeta_{M,N}(ffx_n, gffx_n, t) = 1_{L^*} \).
Using (24) and (26), we have \(gf_{x_n-1} = gg_{x_n} \to gz\) as \(n \to \infty\); this gives \(ff_{x_n} \to gz\) as \(n \to \infty\). Also, using (25) we get

\[
\xi_{MN}(fz, ff_{x_n}, kt) 
\geq \min \{ \xi_{MN}(gz, gz, t), \xi_{MN}(gz, gz, 2t), \\
\xi_{MN}(fz, gz, t), \\
\xi_{MN}(fz, gz, t), \xi_{MN}(gz, gz, t) \}, \tag{43}
\]

Taking \(n \to \infty\), we have

\[
\xi_{MN}(fz, gz, kt) 
\geq \min \{ \xi_{MN}(gz, gz, t), \xi_{MN}(gz, gz, 2t), \\
\xi_{MN}(fz, gz, t), \\
\xi_{MN}(fz, gz, t), \xi_{MN}(gz, gz, t) \}. \tag{44}
\]

By Lemma 17, we get \(fz = gz\). Again, by using \(R\)-weak commutativity of type (P),

\[
\xi_{MN}(ffz, ggz, t) \geq \xi_{MN}(fz, gz, t) \tag{45}
\]

This yields \(ffz = ggz\).

Therefore, \(ffz = fz = gfz = ggz\). Using (25), we get

\[
\xi_{MN}(fz, ffz, kt) 
\geq \min \{ \xi_{MN}(gz, gz, t), \xi_{MN}(gz, gz, 2t), \\
\xi_{MN}(fz, gz, t), \\
\xi_{MN}(fz, gz, t), \xi_{MN}(fz, gz, t) \}, \tag{46}
\]

By Lemma 17, we get \(fz = ffz\). Hence, \(fz = ffz = gfz\) and \(fz\) is a common fixed point of \(f\) and \(g\).

Similarly, we prove that if \(\lim_{n \to \infty} fg(x_n) = fz\).

Uniqueness of the common fixed point theorem follows easily in each of the three cases by using (5).

We now give an example to illustrate Theorem 23.

Example 24 (see [16]). Let \((X, \xi_{MN}, T)\) be modified intuitionistic fuzzy metric space, where \(X = [2, 20]\), as defined in Example 22.

Define \(f, g : X \to X\) by

\[
fx = \begin{cases} 2 & \text{if } x = 2 \text{ or } x > 5, \\
6 & \text{if } 2 < x \leq 5, \\
\frac{(x+1)}{3} & \text{if } x > 5.
\end{cases}
\]

Let \(\{x_n\}\) be a sequence in \(X\) such that either \(x_n = 2\) or \(x_n = 5 + 1/n\) for each \(n\).

Then, clearly, \(f\) and \(g\) satisfy all the conditions of Theorem 23 and have a unique common fixed point at \(x = 2\).

Theorem 25. Let \(f\) and \(g\) be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space \((X, \xi_{MN}, T)\) satisfying (24) and

\[
\xi_{MN}(fx, fy, kt) \geq \max \{ \xi_{MN}(gx, gfx, t), \xi_{MN}(gx, gx, t) \}, \tag{48}
\]

for all \(k \geq 0\)

\[
\xi_{MN}(fx, f^2x, t) \geq \max \{ \xi_{MN}(gx, gfx, t), \xi_{MN}(gx, gx, t) \}, \tag{49}
\]

whenever \(fx \neq f^2x\) for all \(x, y \in X\) and \(t > 0\).

If \(f\) and \(g\) are \(R\)-weakly commuting of type \((A_g)\) or \(R\)-weakly commuting of type \((A_f)\) or \(R\)-weakly commuting of type (P), then \(f\) and \(g\) have common fixed point.

Proof. Since \(f\) and \(g\) are noncompatible maps, there exists a sequence \(\{x_n\}\) in \(X\) such that \(fx_n \to z\) and \(gx_n \to z\) for some \(z\) in \(X\) as \(n \to \infty\) but either \(\lim_{n \to \infty} \xi_{MN}(gx_{x_n}, gfx_{x_n}, t) \neq 1\) or the limit does not exist.

Since \(f(X) \subset g(X)\), for each \(\{x_n\}\) there exists \(\{y_n\}\) in \(X\) such that \(fx_n = gy_n\). Thus, \(fx_n \to z\), \(gx_n \to z\) and \(gy_n \to z\) as \(n \to \infty\). By the virtue of this and using (48), we obtain

\[
\lim_{n \to \infty} \xi_{MN}(fx_n, fy_n, kt) \geq \xi_{MN}(gx_n, gy_n, t), \tag{50}
\]

This gives \(fy_n \to z\) as \(n \to \infty\). Therefore, we have \(fx_n \to z\), \(gx_n \to z\), \(gy_n \to z\), \(fy_n \to z\).

Suppose that \(f\) and \(g\) are \(R\)-weakly commuting of type \((A_g)\). Then, weak reciprocally continuity of \(f\) and \(g\) implies that \(fgx_n \to fz\) or \(gffx_n \to gz\). Similarly, \(fgy_n \to fz\).
or \(gfyn \rightarrow gz\). Let us first assume that \(gfyn \rightarrow gz\). Then, \(R\)-weak commutativity of type \((A_g)\) of \(f\) and \(g\) yields

\[
\zeta_{M,N}(fgy_n,gfy_n,t) \geq_{\L_1} \zeta_{M,N}(fy_n,gy_n,\frac{t}{R}),
\]

\[
\lim_{n \to \infty} \zeta_{M,N}(fgy_n,gz,t) \geq_{\L_1} \zeta_{M,N}(z,z,\frac{t}{R}) = 1_{L_1}.
\]

This gives \(fgy_n \rightarrow gz\). Using (48), we get

\[
\zeta_{M,N}(fgy_n,fz,t) \geq_{\L_1} \zeta_{M,N}(gy_n,gz,t)
\]

\[
\lim_{n \to \infty} \zeta_{M,N}(fgy_n,gz,t) \geq_{\L_1} \zeta_{M,N}(z,z,\frac{t}{R}) = 1_{L_1}.
\]

This yields \(ffyz = gfz\) and \(ffz = fgz = ggz\). If \(fz \neq ffz\), then by using (49), we get

\[
\zeta_{M,N}(fz,f^2z,t)
\]

\[
>_{\L_1} \max\{\zeta_{M,N}(gz,gfz,t),\zeta_{M,N}(fz,gzt),\zeta_{M,N}(f^2z,fgz,t),\zeta_{M,N}(fz,fgz,t),\zeta_{M,N}(fz,ffz,t)\}.
\]

(54) This yields \(ffz = gfz\) and \(ffz = fgz = ggz\). If \(fz \neq ffz\), then using (50), we get

\[
\zeta_{M,N}(fz,f^2z,t) >_{\L_1} 1_{L_1},
\]

which is a contradiction. Hence, \(fz = ffz = gfz\) and \(fz\) is a common fixed point of \(f\) and \(g\).

Similarly, we can prove that if \(gfy_n \rightarrow fz\), then again \(fz\) is a common fixed point of \(f\) and \(g\). Proof is similar if \(f\) and \(g\) are \(R\)-weakly commuting of type \((A_g)\) or \((P)\).

We now give an example to illustrate Theorem 25.

**Example 26 (see [16]).** Let \((X, \zeta_{M,N}, \mathcal{F})\) be modified intuitionistic fuzzy metric space as defined in Example 22 and let \(\{x_n\}\) be a sequence in \(X\) as in Example 22.

Define \(f, g : X \to X\) by

\[
fx = 2 \quad \text{if} \quad x = 2 \quad \text{or} \quad x > 5,
\]

\[
fz = 6 \quad \text{if} \quad 2 < x \leq 5,
\]

\[
gz = 2, \quad gX = 11 \quad \text{if} \quad 2 < x \leq 5,
\]

\[
gz = \frac{(x+1)}{3} \quad \text{if} \quad x > 5.
\]

Let \(\{x_n\}\) be a sequence in \(X\) such that either \(x_n = 2\) or \(x_n = 5 + 1/n\) for each \(n\). Then, clearly, \(f\) and \(g\) satisfy all the conditions of Theorem 25 and have a common fixed point at \(x = 2\).

**Theorem 27.** Let \(f\) and \(g\) be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space \((X, \zeta_{M,N}, \mathcal{F})\) satisfying the conditions (24) and

\[
\zeta_{M,N}(fz, f^2z, t) \geq_{\L_1} \zeta_{M,N}(fz, f^2z, t), \quad k \geq 0,
\]

\[
\zeta_{M,N}(fz, f^2z, t) \geq_{\L_1} \zeta_{M,N}(gz, g^2z, t),
\]

(57) whenever \(fz \neq f^2z\) for all \(x, y \in X\) and \(t > 0\). If \(f\) and \(g\) are \(R\)-weakly commuting of type \((A_g)\) or \(R\)-weakly commuting of type \((P)\), then \(f\) and \(g\) have common fixed point.

**Proof.** Since \(f\) and \(g\) are noncompatible maps, there exists a sequence \(\{x_n\}\) in \(X\) such that \(fx_n \to z\) and \(gx_n \to z\) for some \(z\) in \(X\) as \(n \to \infty\) but either

\[
\lim_{n \to \infty} \zeta_{M,N}(fx_n, fz, t) \neq 1_{L_1},
\]

(58) or the limit does not exist.

Since \(f(X) < g(X)\), for each \(\{x_n\}\), there exists \(\{y_n\}\) in \(X\) such that \(fx_n = gy_n\). Thus, \(fx_n \to z\), \(gx_n \to z\) and \(gy_n \to z\) as \(n \to \infty\). By the virtue of this and (56), we obtain \(fy_n \to z\). Therefore, we have \(fx_n \to z\), \(gx_n \to z\), \(gy_n \to z\).

Suppose that \(f\) and \(g\) are \(R\)-weakly commuting of type \((A_g)\). Then, weak reciprocal continuity of \(f\) and \(g\) implies that \(fgx_n \to fz\) or \(gfX_n \to gz\). Similarly, \(fgy_n \to fz\) or \(gfy_n \to gz\). Let us first assume that \(gfX_n \to gz\). Then, \(R\)-weak commutativity of type \((A_g)\) of \(f\) and \(g\) yields

\[
\zeta_{M,N}(gfX_n, gfy_n, t) \geq_{\L_1} \zeta_{M,N}(fy_n, gyn, \frac{t}{R}),
\]

\[
\lim_{n \to \infty} \zeta_{M,N}(gfX_n, gyz, t) \geq_{\L_1} \zeta_{M,N}(z, z, \frac{t}{R}) = 1_{L_1}.
\]

This gives \(fgy_n \to gz\). Using (56), we get

\[
\zeta_{M,N}(fgy_n, fzx, t) \geq_{\L_1} \zeta_{M,N}(gy_n, gz, t).
\]

(60) Taking \(n \to \infty\), we have

\[
\zeta_{M,N}(gz, fzx, t) \geq_{\L_1} \zeta_{M,N}(gz, gz, t) = 1_{L_1}.
\]

(61) This implies that \(fz = gz\). Again, by the virtue of \(R\)-weak commutativity of type \((A_g)\),

\[
\zeta_{M,N}(fz, gzx, t) \geq_{\L_1} \zeta_{M,N}(fz, gzx, \frac{t}{R}) = 1_{L_1}.
\]

(62) This yields \(fz = gfz\) and \(fz = fgz = ggz\). If \(fz \neq fz\), then using (57), we get

\[
\zeta_{M,N}(fz, f^2z, t) >_{\L_1} \zeta_{M,N}(gz, g^2z, t) = \zeta_{M,N}(fz, f^2z, t).
\]

(63)
which is a contradiction. Hence $fz = ffz = gfz$ and $fz$ is a common fixed point of $f$ and $g$.

Similarly, we can prove that if $fgy_n \to fz$, then again $fz$ is a common fixed point of $f$ and $g$. Proof is similar if $f$ and $g$ are $R$-weakly commuting of type $(A_f)$ or $R$-weakly commuting of type $(P)$. $lacksquare$

We now give an example to illustrate Theorem 27.

Example 28 (see [16]). Let $(X, ξ_{M,N}, 𝜏)$ be modified intuitionistic fuzzy metric space as defined in Example 22 and let $\{x_n\}$ be a sequence in $X$ as in Example 22.

Define $f, g : X \to X$ as follows:

$$
\begin{align*}
fx &= 2 & \text{if } x = 2 \text{ or } x > 5, \\
fx &= 4 & \text{if } 2 < x \leq 5, \\
g2 &= 2, & gx = 4 & \text{if } 2 < x \leq 5, \\
gx &= \frac{(x+1)}{3} & \text{if } x > 5.
\end{align*}
$$

Then, $f$ and $g$ satisfy all the conditions of Theorem 27 and have two common fixed points at $x = 2$ and $x = 4$.

Remark 29. Theorems 23, 25, and 27 generalize the result of Pant et al. [16] for a pair of mappings in modified intuitionistic fuzzy metric space.

4. Fixed Point and Implicit Relation

Let $\Theta$ denote the class of those functions $\theta : (L^*)^5 \to L^*$ such that $\theta$ is continuous and $\theta(x, 1, t, x, x) = x$.

There are examples of $\theta \in \Theta$:

1. $\theta_1(x_1, x_2, x_3, x_4, x_5) = \min\{x_1, x_2, x_3, x_4, x_5\}$,
2. $\theta_2(x_1, x_2, x_3, x_4, x_5) = x_1(x_1 + x_2 + x_3 + x_4 + x_5)/(x_1 + x_3 + x_4 + x_5 + 2x_2)$,
3. $\theta_3(x_1, x_2, x_3, x_4, x_5) = \sqrt{x_1x_2x_3}.$

Now, we prove our results using this implicit relation.

Theorem 30. Let $f$ and $g$ be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space $(X, ξ_{M,N}, 𝜏)$ satisfying the conditions:

$$
\int_0^{ξ_{MN}(fx, fy)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gx, gy)} \psi(s) ds,
$$

$$
\int_0^{ξ_{MN}(fx, f^2x)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gx, g^2x)} \psi(s) ds,
$$

$$
\int_0^{ξ_{MN}(fx, f^3x)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gx, g^3x)} \psi(s) ds
$$

whenever $fx \neq f^2x$ for all $x, y \in X, t > 0$ and for some $\theta \in \Theta$, where $\psi : R^+ \to R$ is a Lebesgue integrable mapping which is summable nonnegative and such that $\int_0^\epsilon \psi(s) ds > 0$ for each $\epsilon > 0$.

If $f$ and $g$ are $R$-weakly commuting of type $(A_f)$ or $R$-weakly commuting of type $(A_g)$ or $R$-weakly commuting of type $(P)$, then $f$ and $g$ have common fixed point.

Proof. Since $f$ and $g$ are noncompatible maps, there exists a sequence $\{x_n\}$ in $X$ such that $fx_n \to z$ and $gx_n \to z$ for some $z$ in $X$ as $n \to \infty$ but either $\lim_{n \to \infty} ξ_{MN}(fgx_n, gfz, t) \neq 1_L$ or the limit does not exist.

Since $f(X) \subset g(X)$, for each $\{x_n\}$, there exists $\{y_n\}$ in $X$ such that $fx_n = gy_n$. Thus, $fx_n \to z, gx_n \to z$ and $gy_n \to z$ as $n \to \infty$. By the virtue of this and using (66), we obtain

$$
\int_0^{ξ_{MN}(fx, fy)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gx, gy)} \psi(s) ds.
$$

Taking $n \to \infty$, we have

$$
\int_0^{ξ_{MN}(z \lim_{n \to \infty} fy_n)} \psi(s) ds \geq L \int_0^{ξ_{MN}(z \lim_{n \to \infty} gx_n)} \psi(s) ds
$$

which implies that $fy_n \to z$ as $n \to \infty$. Therefore, we have $fx_n \to z, gx_n \to z, gy_n \to z, fy_n \to z$.

Suppose that $f$ and $g$ are $R$-weakly commuting of type $(A_f)$. Then, weak reciprocal continuity of $f$ and $g$ implies that $gfz \to fz$ or $gfz \to gz$. Similarly, $fgy_n \to fz$ or $fgy_n \to gz$. Let us first assume that $gfy_n \to gz$. Then $R$-weak commutativity of type $(A_g)$ of $f$ and $g$ yields

$$
\int_0^{ξ_{MN}(fy, fy)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gy, gy)} \psi(s) ds.
$$

This gives $fy_n \to gz$. Using (66), we get

$$
\int_0^{ξ_{MN}(fy, f^2z)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gy, g^2z)} \psi(s) ds.
$$

Taking $n \to \infty$, we have

$$
\int_0^{ξ_{MN}(gz, f^2z)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gz, g^2z)} \psi(s) ds.
$$

This implies that $fz = gz$. Again, by the virtue of $R$-weak commutativity of type $(A_f)$,

$$
\int_0^{ξ_{MN}(fz, fz)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gz, fz)} \psi(s) ds \geq L \int_0^{ξ_{MN}(gz, t)} \psi(s) ds = 1_L.
$$

Journal of Applied Mathematics
This yields $ffz = gfz$ and $ffz = fgz = ggz$. If $fz \neq ffz$, then by using (67), we get

$$
\int_{0}^{\xi_{M,N}(f, f^{2} z, t)} \psi(s) ds > L^{*} \int_{0}^{\xi_{M,N}(f, f^{2} z, t)} \psi(s) ds
$$

which is a contradiction. Hence, $fz = fffz = gfz$ and $fz$ is a common fixed point of $f$ and $g$.

Similarly, we can prove if $fgy_{N} \rightarrow fz$, then, again, $fz$ is a common fixed point of $f$ and $g$. Proof is similar if $f$ and $g$ are $R$-weakly commuting of type $(A_{j})$ or $(P)$. \hfill \Box

wherever $fz \neq f^{2}x$ for all $x, y \in X$, $t > 0$, where $\psi : \mathbb{R}^{+} \rightarrow \mathbb{R}$ is a Lebesgue integrable mapping which is summable nonnegative and such that $\int_{0}^{\theta} \psi(s)ds > 0$ for each $\epsilon > 0$.

If $f$ and $g$ are $R$-weakly commuting of type $(A_{j})$ or $R$-weakly commuting of type $(P)$, then $f$ and $g$ have common fixed point.

**Corollary 31.** Let $f$ and $g$ be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space $(X, \xi_{M,N}, \mathcal{F})$ satisfying the conditions (65), (66) and

$$
\int_{0}^{\xi_{M,N}(f, f^{2} z, t)} \psi(s) ds > L^{*} \int_{0}^{\xi_{M,N}(f, f^{2} z, t)} \psi(s) ds
$$

whenever $fz \neq f^{2}x$ for all $x, y \in \mathbb{X}$, $t > 0$, where $\psi : \mathbb{R}^{+} \rightarrow \mathbb{R}$ is a Lebesgue integrable mapping which is summable nonnegative and such that $\int_{0}^{\theta} \psi(s)ds > 0$ for each $\epsilon > 0$.

If we take $\theta$ as $\theta_{1}$, $\theta_{2}$, $\theta_{3}$, then we get the following corollaries.

**Corollary 32.** Let $f$ and $g$ be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space $(X, \xi_{M,N}, \mathcal{F})$ satisfying the conditions (65), (66) and

$$
\int_{0}^{\xi_{M,N}(f, f^{2} z, t)} \psi(s) ds
$$

which is a contradiction. Hence, $fz = fffz = gfz$ and $fz$ is a common fixed point of $f$ and $g$. Proof is similar if $f$ and $g$ are $R$-weakly commuting of type $(A_{j})$ or $(P)$. Then $f$ and $g$ have common fixed point.

If $f$ and $g$ are $R$-weakly commuting of type $(A_{j})$ or $R$-weakly commuting of type $(P)$, then $f$ and $g$ have common fixed point.

**Corollary 33.** Let $f$ and $g$ be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space $(X, \xi_{M,N}, \mathcal{F})$ satisfying the conditions (65), (66), and

$$
\int_{0}^{\xi_{M,N}(f, f^{2} z, t)} \psi(s) ds > L^{*} \int_{0}^{\xi_{M,N}(f, f^{2} z, t)} \psi(s) ds
$$

whenever $fz \neq f^{2}x$ for all $x, y \in \mathbb{X}$, $t > 0$, where $\psi : \mathbb{R}^{+} \rightarrow \mathbb{R}$ is a Lebesgue integrable mapping which is summable nonnegative and such that $\int_{0}^{\theta} \psi(s)ds > 0$ for each $\epsilon > 0$.

If $f$ and $g$ are $R$-weakly commuting of type $(A_{j})$ or $R$-weakly commuting of type $(P)$, then $f$ and $g$ have common fixed point.

Let $\Delta$ denote the class of those functions $\delta : (L^{*})^{4} \rightarrow L^{*}$ such that $\delta$ is continuous and $\delta(x, y, z, t_{1}, t_{2}, t_{3}, t_{4}) = x$.

There are examples of $\delta \in \Delta$:

1. $\delta_{1}(x_{1}, x_{2}, x_{3}, x_{4}) = \min\{x_{1}, x_{2}, x_{3}, x_{4}\}$
2. $\delta_{2}(x_{1}, x_{2}, x_{3}, x_{4}) = \sqrt{x_{1}x_{3}}$

Now, we prove our main results.

**Theorem 34.** Let $f$ and $g$ be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space $(X, \xi_{M,N}, \mathcal{F})$ satisfying the conditions (65), (66), and

$$
\int_{0}^{\xi_{M,N}(f, f^{2} z, t)} \psi(s) ds
$$

whenever $fz \neq f^{2}x$ for all $x, y \in \mathbb{X}$, $t > 0$, where $\psi : \mathbb{R}^{+} \rightarrow \mathbb{R}$ is a Lebesgue integrable mapping which is summable nonnegative and such that $\int_{0}^{\theta} \psi(s)ds > 0$ for each $\epsilon > 0$.

If $f$ and $g$ are $R$-weakly commuting of type $(A_{j})$ or $R$-weakly commuting of type $(P)$, then $f$ and $g$ have common fixed point.
whenever $f(x) \neq f^2 x$ for all $x, y \in X$, $t > 0$ and for some $\delta \in \Delta$ where $\psi : \mathbb{R}^+ \to \mathbb{R}$ is a Lebesgue integrable mapping which is summable nonnegative and such that $\int_0^\varepsilon \psi(s) \, ds > 0$ for each $\varepsilon > 0$.

If $f$ and $g$ are R-weakly commuting of type $(A_g)$ or R-weakly commuting of type $(A_f)$ or R-weakly commuting of type $(P)$, then $f$ and $g$ have common fixed point.

Proof. Since $f$ and $g$ are noncompatible maps, there exists a sequence $\{x_n\}$ in $X$ such that $f x_n \to z$ and $g x_n \to z$ for some $z$ in $X$ as $n \to \infty$ but either $\lim_{n \to \infty} \delta(\psi(x_n), g x_n, t) \neq 1$ or the limit does not exist. Since $f(X) \subset g(X)$, for each $\{x_n\}$, there exists $\{y_n\}$ in $X$ such that $f x_n = g y_n$. Thus $f x_n \to z$, $g x_n \to z$ and $g y_n \to z$ as $n \to \infty$. By the virtue of this and using (78), we obtain

$$\int_0^{\zeta_{M,N}(f x, f^2 x)} \psi(s) \, ds \geq \int_0^{\zeta_{M,N}(g x, g f x)} \psi(s) \, ds.$$  \hfill (79)

Taking $n \to \infty$, we have

$$\int_0^{\zeta_{M,N}(z, \lim_{n \to \infty} f y_n)} \psi(s) \, ds \geq \int_0^{\zeta_{M,N}(z, x, t)} \psi(s) \, ds$$ \hfill (80)

which implies that, $f y_n \to z$ as $n \to \infty$. Therefore, we have $f x_n \to z$, $g x_n \to z$, $g y_n \to z$, $f y_n \to z$.

Suppose that $f$ and $g$ are R-weakly commuting of type $(A_g)$. Then, weak reciprocal continuity of $f$ and $g$ implies that $f g x_n \to f z$ or $g f x_n \to g z$. Similarly, $f g y_n \to f z$ or $g f y_n \to g z$. Let us first assume that $f g y_n \to g z$. Then R-weak commutativity of type $(A_g)$ of $f$ and $g$ yields

$$\zeta_{M,N}(f g y_n, g f y_n, t) \geq \zeta_{M,N}(f y_n, g y_n, t, R),$$

$$\lim_{n \to \infty} \zeta_{M,N}(f g y_n, g z, t) \geq \zeta_{M,N}(z, z, t, R) = 1.$$ \hfill (81)

This gives $f g y_n \to g z$. Using (78), we get

$$\int_0^{\zeta_{M,N}(f y_n, f^2 y_n)} \psi(s) \, ds \geq \int_0^{\zeta_{M,N}(g y_n, g f y_n)} \psi(s) \, ds.$$ \hfill (82)

Taking $n \to \infty$, we have

$$\int_0^{\zeta_{M,N}(g z, f z)} \psi(s) \, ds \geq \int_0^{\zeta_{M,N}(g z, g f z)} \psi(s) \, ds.$$ \hfill (83)

This implies that $f z = g z$. Again, by the virtue of R-weak commutativity of type $(A_g)$, $\zeta_{M,N}(f f z, g f z, t) \geq 1$. This yields $f f z = g f z$ and $f f z = g f z = g g z$. If $f z \neq f^2 z$, then by using (78), we get

$$\int_0^{\zeta_{M,N}(f z, f^2 z)} \psi(s) \, ds \geq \int_0^{\zeta_{M,N}(g z, g f z)} \psi(s) \, ds.$$ \hfill (84)

which is a contradiction. Hence, $f z = f f z = g f z$ and $f z$ is a common fixed point of $f$ and $g$.

Similarly, we can prove that if $f g y_n \to f z$, then, again, $f z$ is a common fixed point of $f$ and $g$. Proof is similar if $f$ and $g$ are R-weakly commuting of type $(A_f)$ or $(P)$. \hfill \Box

If we take $\delta$ as $\delta_1, \delta_2$, then we get the following corollaries.

**Corollary 35.** Let $f$ and $g$ be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ satisfying the conditions (65), (66), and

$$\int_0^{\zeta_{M,N}(f x, f^2 x)} \psi(s) \, ds$$

$$\geq \int_0^{\min(\zeta_{M,N}(g x, g f x), \zeta_{M,N}(f x, g f x), \zeta_{M,N}(f x, g x), \zeta_{M,N}(f x, g x))} \psi(s) \, ds,$$ \hfill (85)

whenever $f x \neq f^2 x$ for all $x, y \in X$, $t > 0$, where $\psi : \mathbb{R}^+ \to \mathbb{R}$ is a Lebesgue integrable mapping which is summable nonnegative and such that $\int_0^\varepsilon \psi(s) \, ds > 0$ for each $\varepsilon > 0$.

If $f$ and $g$ are R-weakly commuting of type $(A_g)$ or R-weakly commuting of type $(A_f)$ or R-weakly commuting of type $(P)$, then $f$ and $g$ have common fixed point.

**Corollary 36.** Let $f$ and $g$ be weakly reciprocally continuous noncompatible self-mappings of a modified intuitionistic fuzzy metric space $(X, \zeta_{M,N}, \mathcal{F})$ satisfying the conditions (65), (66), and

$$\int_0^{\zeta_{M,N}(f x, f^2 x)} \psi(s) \, ds$$

$$> \int_0^{\zeta_{M,N}(f x, f^2 x)} \psi(s) \, ds,$$ \hfill (86)

whenever $f x \neq f^2 x$ for all $x, y \in X$, $t > 0$ and for some $\delta \in \Delta$, where $\psi : \mathbb{R}^+ \to \mathbb{R}$ is a Lebesgue integrable mapping which is summable nonnegative and such that $\int_0^\varepsilon \psi(s) \, ds > 0$ for each $\varepsilon > 0$. 
If $f$ and $g$ are $R$-weakly commuting of type $(A_g)$ or $R$-weakly commuting of type $(A_f)$ or $R$-weakly commuting of type $(P)$, then $f$ and $g$ have common fixed point.
