We first introduce a new mixed equilibrium problem with a relaxed monotone mapping in Banach spaces and prove the existence of solutions of the equilibrium problem. Then we introduce a new iterative algorithm for finding a common element of the set of solutions of the equilibrium problem and the set of fixed points of a quasi-$\phi$-nonexpansive mapping and prove some strong convergence theorems of the iteration. Our results extend and improve the corresponding ones given by Wang et al., Takahashi and Zembayashi, and some others.

1. Introduction

Let $E$ be a Banach space with the dual space $E^*$ and let $K$ be a nonempty closed convex subset of $E$. Let $\Theta$ be a bifunction from $K \times K$ to $\mathbb{R}$, where $\mathbb{R}$ denotes the set of numbers. The equilibrium problem is to find $x^* \in K$ such that

$$\Theta(x^*, y) \geq 0, \quad \forall y \in K. \quad (1)$$

The set of solutions of the above equilibrium problem is denoted by $\text{EP}(\Theta)$.

In order to solve the equilibrium problem, the bifunction $\Theta$ is usually to be assumed that following conditions are satisfied:

(A1) $\Theta(x, x) = 0$ for all $x \in K$;

(A2) $\Theta$ is monotone; that is, $\Theta(x, y) + \Theta(y, x) \leq 0$ for all $x, y \in K$;

(A3) for all $x, y, z \in K$,

$$\limsup_{t \downarrow 0} \Theta(tx + (1-t)x, y) \leq \Theta(x, y); \quad (2)$$

(A4) for all $x \in K$, $\Theta(x, \cdot)$ is convex and lower semicontinuous.

Recently, Takahashi and Zembayashi [1] extended the equilibrium problems and fixed point problems from Hilbert spaces to Banach spaces. More precisely, they gave the following iterative scheme:

$$x_0 = x \in K,$$

$$y_n = J^{-1} \left( \alpha_n Jx + (1 - \alpha_n) JSx_n \right),$$

$$u_n \in K \text{ such that } \Theta(u_n, y) + \frac{1}{r_n} \langle y - u_n, Jy - Ju_n \rangle \geq 0, \quad \forall y \in K, \quad (3)$$

$$H_n = \{ z \in K : \phi(z, u_n) \leq \phi(z, x_n) \},$$

$$W_n = \{ z \in K : \langle x_n - z, Jx - Jx_n \rangle \geq 0 \},$$

$$x_{n+1} = \Pi_{H_n \cap W_n} x_n, \quad \forall n \geq 0,$$

where $S$ is a relatively nonexpansive mapping from $K$ into itself such that $F(S) \cap \text{EP}(\Theta) \neq \emptyset$. $J$ is the duality mapping on $E$, and $\{\alpha_n\} \subset [0, 1]$ satisfies $\liminf_{n \to \infty} \alpha_n (1 - \alpha_n) > 0$ and $\{r_n\} \subset [a, \infty)$ for some $a > 0$. They proved that the sequence $\{x_n\}$ generated by (3) converges strongly to $\Pi_{F(S) \cap \text{EP}(\Theta)} x$, where $\Pi_{F(S) \cap \text{EP}(\Theta)}$ is the generalized projection of $E$ onto $F(S) \cap \text{EP}(\Theta)$. \[\square\]

We first introduce a new mixed equilibrium problem with a relaxed monotone mapping in Banach spaces and prove the existence of solutions of the equilibrium problem. Then we introduce a new iterative algorithm for finding a common element of the set of solutions of the equilibrium problem and the set of fixed points of a quasi-$\phi$-nonexpansive mapping and prove some strong convergence theorems of the iteration. Our results extend and improve the corresponding ones given by Wang et al., Takahashi and Zembayashi, and some others.

1. Introduction

Let $E$ be a Banach space with the dual space $E^*$ and let $K$ be a nonempty closed convex subset of $E$. Let $\Theta$ be a bifunction from $K \times K$ to $\mathbb{R}$, where $\mathbb{R}$ denotes the set of numbers. The equilibrium problem is to find $x^* \in K$ such that

$$\Theta(x^*, y) \geq 0, \quad \forall y \in K. \quad (1)$$

The set of solutions of the above equilibrium problem is denoted by $\text{EP}(\Theta)$.

In order to solve the equilibrium problem, the bifunction $\Theta$ is usually to be assumed that following conditions are satisfied:

(A1) $\Theta(x, x) = 0$ for all $x \in K$;

(A2) $\Theta$ is monotone; that is, $\Theta(x, y) + \Theta(y, x) \leq 0$ for all $x, y \in K$;

(A3) for all $x, y, z \in K$,

$$\limsup_{t \downarrow 0} \Theta(tx + (1-t)x, y) \leq \Theta(x, y); \quad (2)$$

(A4) for all $x \in K$, $\Theta(x, \cdot)$ is convex and lower semicontinuous.

Recently, Takahashi and Zembayashi [1] extended the equilibrium problems and fixed point problems from Hilbert spaces to Banach spaces. More precisely, they gave the following iterative scheme:

$$x_0 = x \in K,$$

$$y_n = J^{-1} \left( \alpha_n Jx + (1 - \alpha_n) JSx_n \right),$$

$$u_n \in K \text{ such that } \Theta(u_n, y) + \frac{1}{r_n} \langle y - u_n, Jy - Ju_n \rangle \geq 0, \quad \forall y \in K, \quad (3)$$

$$H_n = \{ z \in K : \phi(z, u_n) \leq \phi(z, x_n) \},$$

$$W_n = \{ z \in K : \langle x_n - z, Jx - Jx_n \rangle \geq 0 \},$$

$$x_{n+1} = \Pi_{H_n \cap W_n} x_n, \quad \forall n \geq 0,$$

where $S$ is a relatively nonexpansive mapping from $K$ into itself such that $F(S) \cap \text{EP}(\Theta) \neq \emptyset$. $J$ is the duality mapping on $E$, and $\{\alpha_n\} \subset [0, 1]$ satisfies $\liminf_{n \to \infty} \alpha_n (1 - \alpha_n) > 0$ and $\{r_n\} \subset [a, \infty)$ for some $a > 0$. They proved that the sequence $\{x_n\}$ generated by (3) converges strongly to $\Pi_{F(S) \cap \text{EP}(\Theta)} x$, where $\Pi_{F(S) \cap \text{EP}(\Theta)}$ is the generalized projection of $E$ onto $F(S) \cap \text{EP}(\Theta)$. \[\square\]
Very recently, Qin et al. [2] introduced the following hybrid algorithm to solve the equilibrium problems and fixed point problems for quasi-\(\phi\)-nonexpansive mappings in a uniformly convex and uniformly smooth Banach space \(E\) with a nonempty closed convex subset \(K\) of \(E\):

\[
\begin{align*}
x_0 &\in E \text{ chosen arbitrarily,} \\
x_1 &\in \Pi_{C_1}x_0, \\
y_n &\in J^{-1}\left(\alpha_n Jx_n + \beta_n JTx_n + \gamma_n Jx_n\right), \\
u_n &\in K \text{ such that } \\
&\quad + \frac{1}{r_n} \langle y - u_n, Jy_n - Jy_n \rangle \geq 0, \quad \forall y \in K, \\
\end{align*}
\]

(4)

where \(T\) and \(S\) are two quasi-\(\phi\)-nonexpansive mappings from \(K\) into itself such that \(F = F(T) \cap F(S) \cap EP(\Theta) \neq \emptyset\), \([\alpha_n]\), \([\beta_n]\), and \([\gamma_n]\) are three sequences in \([0, 1]\) satisfying some certain conditions. They proved that the sequence \([x_n]\) generated by (4) converges strongly to \(\Pi_{\Omega}x_0\), where \(\Pi_{\Omega}\) is the generalized projection of \(E\) onto \(F\).

In [3], Fang and Huang introduced a concept called a relaxed \(\eta\)-\(\alpha\)-monotone mapping.

A mapping \(A : K \to E^*\) is said to be relaxed \(\eta\)-\(\alpha\)-monotone if there exist a mapping \(\eta : K \times K \to E\) and a function \(\alpha : E \to \mathbb{R}\) with \(\alpha(tz) = t^\theta \alpha(z)\) for all \(t > 0\) and \(z \in E\), where \(\theta > 1\) is a constant, such that

\[
\langle Ax - Ay, \eta(x, y) \rangle \geq \alpha(x - y), \quad \forall x, y \in K. \quad (5)
\]

Especially, if \(\eta(x, y) = x - y\) for all \(x, y \in K\) and \(\alpha(z) = \kappa \|z\|^\theta\), where \(\kappa > 1\) and \(\theta > 1\) are two constants, then \(A\) is said to be \(p\)-monotone (see, e.g., [4–6]). They proved that, under some suitable assumptions, the following variational inequality is solvable: find \(x \in E\) such that

\[
\langle Ax - Ay, \eta(x, y) \rangle + f(y) - f(x) \geq 0, \quad \forall y \in K, \quad (6)
\]

where \(f\) is a function from \(K\) to \(\mathbb{R}_+\cup\{0\}\). They also proved that the variational inequality (6) is equivalent to the following: find \(x \in K\) such that

\[
\langle Ay, \eta(x, y) \rangle + f(y) - f(x) \geq \alpha(y - x), \quad \forall y \in K. \quad (7)
\]

In this paper, let us denote the set of solutions of the variational inequality (6) or (7) by \(\Omega\).

It is worthy to notice that it is possible that \(\Omega\) is a singleton set, includes the finite elements or infinite elements. To show this, we see the following example.

**Example 1.** Let \(E = \mathbb{R} \times \mathbb{R}\) and \(K = [0, 1] \times [0, 1]\). Define the mappings \(A : K \to E^*\) by \(A(x_1, x_2) = (x_1, x_2)\) for all \((x_1, x_2) \in K\), \(\alpha : E \to \mathbb{R}\) by \(\alpha((x_1, x_2)) = 3x_1^3 + 3x_2^2\) for all \((x_1, x_2) \in E\), and \(\eta : K \times K \to E\) by \(\eta((x_1, x_2), (y_1, y_2)) = (4(x_1 - y_1), 4(x_2 - y_2))\) for all \((x_1, x_2) \times (y_1, y_2) \in K \times K\). Then the mapping \(A\) is a relaxed \(\eta\)-\(\alpha\)-monotone mapping. In fact, for all \(x = (x_1, x_2), y = (y_1, y_2) \in K\), we have

\[
\langle Ax - Ay, \eta(x, y) \rangle = \langle (x_1 - y_1, x_2 - y_2), (4(x_1 - y_1), 4(x_2 - y_2)) \rangle
\]

\[
= 16 \left[ (x_1 - y_1)^2 + (x_2 - y_2)^2 \right] \geq 3 \left[ (x_1 - y_1)^2 + (x_2 - y_2)^2 \right] = \alpha(x - y). \quad (8)
\]

Hence, \(A\) is a relaxed \(\eta\)-\(\alpha\)-monotone mapping. Now by defining the different function \(f\) we find the solution set \(\Omega\) of (6). First we compute, for \(x = (x_1, x_2), y = (y_1, y_2) \in K\),

\[
\langle Ax, \eta(y, x) \rangle + f(y) - f(x) = \langle (x_1, x_2), (y_1, y_2) \rangle + f(y) - f(x)
\]

\[
= \langle (x_1, x_2), (4(y_1 - 1), 4(y_2 - 2)) \rangle + f(y) - f(x)
\]

\[
= 4x_1(y_1 - x_1) + 4x_2(y_2 - x_2) + f(y) - f(x). \quad (9)
\]

(i) Let the function \(f(x) = x_1 + x_2\) for all \(x = (x_1, x_2) \in K\). It is easy to see that the solution set \(\Omega = \{(0, 0)\}\). That is, only when \(x = (0, 0)\), (6) holds for all \(y \in K\).

(ii) Let the function \(f(1, 1) = -20\) and \(f(x_1, x_2) = x_1 + x_2\) for all \(K \setminus \{(1, 1)\}\). By (9), it is not hard to see that the solution set \(\Omega = \{(0, 0), (1, 1)\}\).

(iii) Let the function \(f(x_1, x_2) = -20\) for all \((x_1, x_2) = (1/n, 1/n) \in K\) where \(n \in \mathbb{N}\) and \(f(x_1, x_2) = x_1 + x_2\) for all \(K \setminus \{(1/n, 1/n) : n \in \mathbb{N}\}\). Then by (9) we see that \(\Omega = \{(0, 0), (1/n, 1/n) : n \in \mathbb{N}\}\). In this case, \(\Omega\) includes the infinite elements.

Recently, Wang et al. [7] proposed the following equilibrium problem in a Hilbert space \(H\) with a nonempty closed convex bounded subset \(K\): find \(x \in K\) such that

\[
\Theta(x, y) + \langle Tz, \eta(y, z) \rangle \geq 0, \quad \forall y \in K, \quad (10)
\]

where \(T : K \to H\) is a relaxed \(\eta\)-\(\alpha\)-monotone mapping. They introduced a new algorithm for solving the equilibrium problem in Hilbert spaces.

In [3], Fang and Huang did not give the algorithm to solve the variational inequality (6) or (7). In this paper, motivated and inspired by the above results, we introduced a new mixed equilibrium problem with the relaxed monotone mapping and prove the existence of solutions of the mixed equilibrium problem. Then we propose an iterative scheme to find the common element of the set of solutions of the mixed equilibrium problem and the set of fixed points of a quasi-\(\phi\)-nonexpansive mapping in Banach spaces. In particular, the variational inequality (6) or (7) may be solved by the algorithm proposed in this paper. Our results extend and improve the corresponding ones given by Takahashi and Zembayashi [1], Fang and Huang [3], and Wang et al. [7].
2. Preliminaries

A Banach space $E$ is said to be strictly convex if $\| \frac{x+y}{2} \| < 1$ for all $x, y \in E$ with $\|x\| = \|y\| = 1$ and $x \neq y$. It is said to be uniformly convex if $\lim_{n \to \infty} \|x_n - y_n\| = 0$ for any two sequences $\{x_n\}$ and $\{y_n\}$ in $E$ such that $\|x_n\| = \|y_n\| = 1$ and $\lim_{n \to \infty} \|x_n + y_n\|/2 = 1$.

Let $U = \{x \in E : \|x\| = 1\}$ be the unit sphere of $E$. A Banach space $E$ is said to be smooth provided

$$\lim_{t \to 0} \frac{\|x + ty\| - \|x\|}{t}$$

exists for each $x, y \in U$. It is said to be uniformly smooth if the limit is attained uniformly for $x, y \in E$.

Let $E^*$ be the topological dual space of $E$ and $J$ be the normalized duality mapping from $E$ into $2^{E^*}$ given by

$$Jx = \{x^* \in E^* : \langle x, x^* \rangle = \|x\| \|x^*\|, \|x^*\| = \|x\|\}, \forall x \in E.$$ (12)

It is well known that if $E$ is uniformly convex, then $J$ is uniformly continuous on bounded subsets of $E$ and if $E$ is uniformly smooth, then $E^*$ is uniformly convex.

Recently, Alber [8] introduced a generalized projection operator $\Pi_K$ in a Banach space $E$ with a nonempty closed convex subset $K$, which is an analogue of the metric projection in Hilbert spaces:

Let $\phi : E \times E \to \mathbb{R}$ be a function defined by

$$\phi(x, y) = \|x\|^2 - 2 \langle x, Jy \rangle + \|y\|^2, \forall x, y \in E.$$ (13)

The generalized projection $\Pi_K : E \to K$ is a mapping that assigns to an arbitrary point $x \in E$ the minimum point of the functional $\phi(x, y)$; that is, $\Pi_K x = \bar{x}$, where $\bar{x}$ is a solution to the minimization problem

$$\phi(\bar{x}, x) = \inf_{y \in K} \phi(y, x).$$ (14)

The existence and uniqueness of $\Pi_K$ follows from the properties of the function $\phi(x, y)$ and the strict monotonicity of the mapping $J$ (see, e.g., [8–12]).

Let $E$ be a smooth, strictly convex, and reflexive Banach space $E$. Then, for all $x, y \in E$, we have the following [8, 9, 11]:

$$(\|y\| - \|x\|)^2 \leq \phi(x, y) \leq (\|y\| + \|x\|)^2,$$ (15)

$$\phi(x, y) = 0 \iff x = y.$$

Let $T$ be a mapping from $K$ into itself. A point $p \in K$ is said to be an asymptotic fixed point of $T$ [13] if $K$ contains a sequence $\{x_n\}$ which converges weakly to $p$ such that

$$\lim_{n \to \infty} \|x_n - Tx_n\| = 0.$$ (16)

The set of asymptotic fixed points of $T$ is denoted by $\hat{F}(T)$. The mapping $T$ is said to be relatively nonexpansive [14–16] if

$$\hat{F}(T) = F(T), \quad \phi(p, Tx) \leq \phi(p, x),$$

$$\forall x \in K, \ p \in F(T).$$ (17)

We recall that a mapping $T : K \to K$ is said to be nonexpansive if $\|Tx - Ty\| \leq \|x - y\|$ for all $x, y \in K$, $T$ is said to be $\phi$-nonexpansive if $\phi(Tx, Ty) \leq \phi(x, y)$ for all $x, y \in K$, and $T$ is said to be quasi-$\phi$-nonexpansive if

$$F(T) \neq \emptyset, \quad \phi(p, Tx) \leq \phi(p, x), \quad \forall x \in K, \ p \in F(T).$$ (18)

Notice that the class of quasi-$\phi$-nonexpansive mappings is more general than the class of relatively nonexpansive mappings [14–16] which requires the strong restriction that $\hat{F}(T) = F(T)$. Some examples of quasi-$\phi$-nonexpansive mappings may be found in [2].

A mapping $S : E \to E$ is said to be closed if for any sequence $\{x_n\} \subset E$ such that $\lim_{n \to \infty} x_n = x_0$ and $\lim_{n \to \infty} Sx_n = y_0$, then $Sx_0 = y_0$.

The following lemmas are needed for the proof of our main results in next section.

**Lemma 2** (see [10]). Let $E$ be a uniformly convex and smooth Banach space and let $\{x_n\}, \{y_n\}$ be two sequences of $E$. If $\phi(x_n, y_n) \to 0$ and either $\{x_n\}$ or $\{y_n\}$ is bounded, then

$$\frac{x_n - y_n}{\|x_n - y_n\|} \to 0.$$ (19)

**Lemma 3** (see [8]). Let $K$ be a nonempty closed convex subset of a smooth Banach space $E$ and $x \in E$. Then $x_0 = \Pi_K x$ if and only if

$$\langle x_0 - y, Jx_0 \rangle \geq 0, \quad \forall y \in K.$$ (20)

The following lemma is contained implicitly in Step 1 of Theorem 3.1 of [17].

**Lemma 5** (see [17]). Let $E$ be a uniformly convex and smooth Banach space, let $K$ be a nonempty closed convex subset of $E$, and let $T$ be a closed quasi-$\phi$-nonexpansive mapping from $K$ into itself. Then $F(T)$ is a closed convex subset of $K$.

**Lemma 6** (see [18]). Let $E$ be a uniformly convex Banach space and let $B_r(0)$ be a closed ball of $E$. Then there exists a continuous strictly increasing convex function $g : [0, \infty) \to [0, \infty)$ with $g(0) = 0$ such that

$$\|\lambda x + \mu y + \gamma z\|^2 \leq \lambda \|x\|^2 + \mu \|y\|^2 + \gamma \|z\|^2 - \lambda \mu g(\|x - y\|)$$ (21)

for all $x, y, z \in B_r(0)$ and $\lambda, \mu, \gamma \in [0, 1]$ with $\lambda + \mu + \gamma = 1$.

3. Main Results

For our main results, we introduce some definitions and lemmas as follows.
Definition 7 (see [3]). Let $E$ be a Banach space with the dual space $E^*$ and let $K$ be a nonempty subset of $E$. Let $A : K \to E^*$ and $\eta : K \times K \to E^*$ be two mappings. The mapping $A : K \to E^*$ is said to be $\eta$-hemicontinuous if, for any fixed $x, y \in K$, the function $f : [0, 1] \to (-\infty, \infty)$ defined by $f(t) = \langle A((1-t)x + ty), \eta(x, y) \rangle$ is continuous at $0$. 

Definition 8. Let $E$ be a Banach space with the dual space $E^*$ and let $K$ be a nonempty subset of $E$. A mapping $F : K \to 2^E$ is said to be a KKM mapping if, for any $\{x_1, \ldots, x_n\} \subset K$, 

$$\overline{\text{co}} \{x_1, \ldots, x_n\} \subset \bigcap_{i=1}^{n} F(x_i),$$ 

where $2^E$ denotes the family of all the nonempty subsets of $E$.

Lemma 9 (see [19]). Let $M$ be a nonempty subset of a Hausdorff topological vector space $X$ and let $F : M \to 2^X$ be a KKM mapping. If $F(x)$ is closed in $X$ for all $x \in X$ in $K$ and compact for some $x \in X$, then $\cap_{x \in M} F(x) \neq \emptyset$.

Lemma 10. Let $E$ be a reflexive Banach space with the dual space $E^*$ and let $K$ be a nonempty subset of $K$. Let $A : K \to E^*$ be an $\eta$-hemicontinuous and relaxed $\eta$-monotone mapping. Let $\Theta$ be a bifunction from $K \times K$ to $\mathbb{R}$.

The convexity of $f$ and conditions (i), (ii), (A1), and (A4) imply that 

$$f(y) = +\infty$$

for all $y \in K$. Assume that 

(i) $\eta(x, x) = 0$ for all $x \in K$; 
(ii) for any fixed $u, v \in K$, the mapping $x \mapsto \langle Ay, \eta(x, u) \rangle$ is convex.

Then the following problems (23) and (24) are equivalent:

(I) find $x \in K$ such that 

$$\Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq 0, \quad \forall y \in K;$$

(23)

(II) find $x \in K$ such that 

$$\Theta(x, y) + \langle Ay, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq \alpha(y - x), \quad \forall y \in K.$$ 

(24)

Proof. Let $x \in K$ be a solution of the problem (23). Since $A$ is relaxed $\eta$-monotone, we have 

$$\Theta(x, y) + \langle Ay, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq \Theta(x, y) + \alpha(y - x) + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq \alpha(y - x), \quad \forall y \in K.$$ 

(25)

Thus, $x \in K$ is a solution of the problem (24).

Conversely, let $x \in K$ be a solution of the problem (24) and let $y \in K$ be any point with $f(y) < \infty$. From (24), it follows that $f(x) < \infty$. Letting 

$$y_t = (1-t)x + ty, \quad \forall t \in (0, 1),$$

we have $x \in K$. Since $x \in K$ is a solution of the problem (24), it follows that 

$$\Theta(x, y) + \langle Ay, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq 0$$

(26)

Thus, it follows from (27)-(28) that 

$$\Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq \alpha(y - x), \quad \forall y \in K.$$ 

(29)

Since $A$ is $\eta$-hemicontinuous and $p > 1$, letting $t \to 0$ in (29), we get 

$$\Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq 0$$

(30)

for all $y \in K$ with $f(y) < \infty$. When $f(y) = +\infty$, the relation 

$$\Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq 0$$

(31)

is trivial. Therefore, $x \in K$ is also a solution of the problem (23). This completes the proof.

Lemma 11. Let $E$ be a reflexive Banach space with the dual space $E^*$ and let $K$ be a nonempty closed convex bounded subset of $E$. Let $A : K \to E^*$ be an $\eta$-hemicontinuous and relaxed $\eta$-monotone mapping, let $\Theta$ be a bifunction from $K \times K$ to $\mathbb{R}$.
satisfying (A1) and (A4), and let \( f \) be a proper convex function from \( K \times K \) to \( \mathbb{R} \cup \{+\infty\} \). Let \( r > 0 \) and \( z \in E \). Assume that

(i) \( \eta(x, y) + \eta(y, x) = 0 \) for all \( x, y \in K \);
(ii) for any fixed \( u, v \in K \), the mapping \( x \mapsto \langle Av, \eta(x, u) \rangle \) is convex and lower semicontinuous;
(iii) \( \alpha : E \to \mathbb{R} \) is weakly lower semicontinuous; that is, for any net \( \{x_\beta\} \), \( \{x_\beta\} \) converges to \( x \) in \( \sigma(E, E^*) \) implying that \( \alpha(x) \leq \liminf \alpha(x_\beta) \).

Then the problem (23) is solvable.

Proof. Define two set-valued mappings \( F, G : K \to 2^E \) as follows:

\[
F(y) = \left\{ x \in K : \Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq 0 \right\}, \quad \forall y \in K,
\]

\[
G(y) = \left\{ x \in K : \Theta(x, y) + \langle Ay, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq \alpha(y - x) \right\}, \quad \forall y \in K,
\]

respectively.

Now, we claim that \( F \) is a KKM mapping. If \( F \) is not a KKM mapping, then there exist \( \{y_1, \ldots, y_n\} \subset K \) and \( t_i > 0 \), \( i = 1, \ldots, n \), such that

\[
\sum_{i=1}^{n} t_i = 1, \quad y = \sum_{i=1}^{n} t_i y_i \notin \bigcup_{i=1}^{n} F(y_i).
\]

By the definition of \( F \), we have

\[
\Theta(y, y_i) + \langle Ay, \eta(y, y_i) \rangle + f(y_i) - f(y) + \frac{1}{r} \langle y_i - y, Jy - Jz \rangle < 0, \quad \forall i = 1, \ldots, n.
\]

It follows that

\[
0 = \Theta(y, y) = \Theta\left(y, \sum_{i=1}^{n} t_i y_i\right) + \left\langle Ay, \eta\left(\sum_{i=1}^{n} t_i y_i, y\right)\right\rangle \leq \sum_{i=1}^{n} t_i \Theta(y, y_i) + \sum_{i=1}^{n} t_i \langle Ay, \eta(y_i, y_i) \rangle \leq \sum_{i=1}^{n} t_i \left(f(y) - f(y_i) + \frac{1}{r} \langle y - y_i, Jy - Jz \rangle \right) \leq f(y) - \sum_{i=1}^{n} t_i f(y_i) \leq f(y) - f(y)
\]

\[
= 0,
\]

which is a contradiction. This implies that \( F \) is a KKM mapping.

Now, we prove that

\[
F(y) \subset G(y), \quad \forall y \in K.
\]

For any given \( y \in K \), letting \( x \in F(y) \), then

\[
\Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq 0.
\]

Since \( A \) is relaxed \( \eta, \alpha \)-monotone, we have

\[
\Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq \Theta(x, y) + \langle Ax, \eta(y, x) \rangle + \alpha(y - x) \geq \alpha(y - x),
\]

which implies that \( x \in G(y) \) and so

\[
F(y) \subset G(y), \quad \forall y \in K.
\]

As in the proof of Theorem 2.2 in [3], also, we can obtain

\[
\bigcap_{y \in K} F(y) = \bigcap_{y \in K} G(y) \neq \emptyset.
\]

Hence, there exists \( x \in K \) such that

\[
\Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) + \frac{1}{r} \langle y - x, Jx - Jz \rangle \geq 0, \quad \forall y \in K.
\]

This completes the proof.

Next, let us denote the set of solutions of the following mixed equilibrium problem by \( EP(\Theta, A) \): find \( x \in K \) such that

\[
\Theta(x, y) + \langle Ax, \eta(y, x) \rangle + f(y) - f(x) \geq 0, \quad \forall y \in K.
\]

It is easy to see that if \( \Theta(x, y) \equiv 0 \) for all \( x, y \in K \), then the above mixed equilibrium problem reduces to the variational inequality problem (6) or (7).

Lemma 12. Let \( E \) be a uniformly smooth, strictly convex Banach space with the dual space \( E^* \) and let \( K \) be a nonempty closed convex bounded subset of \( E \). Let \( A : K \to E^* \) be an \( \eta \)-hemiconcave and relaxed \( \eta, \alpha \)-monotone mapping, let \( \Theta \) be a bifunction from \( K \times K \) to \( \mathbb{R} \) satisfying (A1), (A2), and (A4), and let \( f \) be a proper convex function from \( K \times K \) to \( \mathbb{R} \cup \{+\infty\} \). Let \( r > 0 \) and define a mapping \( T_r : E \to K \) as follows:

\[
T_r(x) = \left\{ z \in K : \Theta(z, y) + \langle Az, \eta(y, z) \rangle + f(y) - f(z) + \frac{1}{r} \langle y - z, Jz - Jx \rangle \geq 0, \quad \forall y \in K \right\}
\]
for all $x \in E$. Assume that

(i) $\eta(x, y) + \eta(y, x) = 0$, for all $x, y \in K$;
(ii) for any fixed $u, v \in K$, the mapping $x \mapsto \langle Av, \eta(x, u) \rangle$ is convex and lower semicontinuous;
(iii) $\alpha : E \to \mathbb{R}$ is weakly lower semicontinuous; that is, for any net $\{x_\beta\}$, $x_\beta$ converges to $x$ in $\sigma(E, E')$ implying that $\alpha(x) \leq \liminf \alpha(x_\beta)$;
(iv) for any $x, y \in K$, $\alpha(x - y) + \alpha(y - x) \geq 0$;
(v) $\langle A(tz_1 + (1 - t)z_2), \eta(y, tz_1 + (1 - t)z_2) \rangle \geq t\langle Az_1, \eta(y, z_1) \rangle + (1 - t)\langle Az_2, \eta(y, z_2) \rangle$, for any $z_1, z_2, y \in K$ and $t \in [0, 1]$.

Then the following hold:

(1) $T_r$ is single-valued;
(2) $T_r$ is a firmly nonexpansive-type mapping; that is, for all $x, y \in E$,

$$\langle T_r(x - T_r y, JTx - JTy) \rangle \leq \langle T_r(x - Ty, JTx - JTy) \rangle;$$

(3) $F(T_r) = EP(\Theta, A)$;
(4) $T_r$ is quasi-$\phi$-nonexpansive satisfying $\phi(w, T_r x) + \phi(T_r x, x) \leq \phi(w, x)$ for all $w \in F(T_r)$ and $x \in E$;
(5) $EP(\Theta, A)$ is closed and convex.

Proof. We claim that $T_r$ is single-valued. Indeed, for any $x \in C$ and $r > 0$, let $z_1, z_2 \in T_r x$. Then we have

$$\begin{align*}
\Theta(z_1, z_2) + \langle Az_1, \eta(z_2, z_1) \rangle + f(z_2) - f(z_1) \\
+ \frac{1}{r} \langle z_2 - z_1, Jz_1 - Jx \rangle &\geq 0, \\
\Theta(z_2, z_1) + \langle Az_2, \eta(z_1, z_2) \rangle + f(z_1) - f(z_2) \\
+ \frac{1}{r} \langle z_1 - z_2, Jz_2 - Jx \rangle &\geq 0.
\end{align*}$$

Adding the two inequalities, it follows from (i) that

$$\begin{align*}
\Theta(z_1, z_2) + \Theta(z_2, z_1) + \langle Az_1 - Az_2, \eta(z_2, z_1) \rangle \\
+ \frac{1}{r} \langle z_1 - z_2, Jz_2 - Jz_1 \rangle &\geq 0.
\end{align*}$$

Thus, from (A2), we have

$$\langle Az_1 - Az_2, \eta(z_2, z_1) \rangle + \frac{1}{r} \langle z_1 - z_2, Jz_2 - Jz_1 \rangle \geq 0;$$

that is,

$$\frac{1}{r} \langle z_1 - z_2, Jz_2 - Jz_1 \rangle \geq \langle Az_2 - Az_1, \eta(z_2, z_1) \rangle. \quad (48)$$

Since $T$ is relaxed $\eta$-$\alpha$-monotone and $r > 0$, one has

$$\langle z_1 - z_2, Jz_2 - Jz_1 \rangle \geq \alpha(z_2 - z_1). \quad (49)$$

In (48), exchanging $z_1$ to $z_2$, we get

$$\begin{align*}
\frac{1}{r} \langle z_2 - z_1, Jz_1 - Jz_2 \rangle &\geq \langle Az_1 - Az_2, \eta(z_1, z_2) \rangle \\
&\geq \alpha(z_1 - z_2);
\end{align*}$$

that is,

$$\langle z_1 - z_2, Jz_2 - Jz_1 \rangle \geq r\alpha(z_1 - z_2). \quad (51)$$

Thus, it follows from (49), (51), and (iv) that

$$\langle z_1 - z_2, Jz_2 - Jz_1 \rangle \geq 0. \quad (52)$$

Since $E$ is strictly convex, we have $z_1 = z_2$.

Next, we claim that $T_r$ is a firmly nonexpansive-type mapping. Indeed, for any $x, y \in K$, we have

$$\begin{align*}
\Theta(T_r x, T_r y) + \langle AT_r x, \eta(T_r y, T_r x) \rangle &+ f(T_r y) - f(T_r x) \\
+ \frac{1}{r} \langle T_r y - T_r x, JTx - Jx \rangle &\geq 0, \\
\Theta(T_r y, T_r x) + \langle AT_r y, \eta(T_r x, T_r y) \rangle &+ f(T_r x) - f(T_r y) \\
+ \frac{1}{r} \langle T_r x - T_r y, JTx - Jy \rangle &\geq 0.
\end{align*}$$

Adding the above two inequalities, by (i) and (A2), we get

$$\begin{align*}
\langle AT_r x - AT_r y, \eta(T_r y, T_r x) \rangle \\
+ \frac{1}{r} \langle T_r y - T_r x, JTx - JTx + Jy \rangle &\geq 0;
\end{align*}$$

that is,

$$\frac{1}{r} \langle T_r y - T_r x, JTx - JTx + Jy \rangle \geq \langle AT_r y - AT_r x, \eta(T_r y, T_r x) \rangle. \quad (53)$$

Repeating the process from (48) to (52), we can obtain

$$\langle T_r y - T_r x, JTx - JTx + Jy \rangle \geq 0. \quad (56)$$

Therefore, we have

$$\langle T_r x - T_r y, JTx - JTx + Jy \rangle \leq \langle T_r x - T_r y, Jy - Jy \rangle, \quad (57)$$

which shows that $T_r$ is firmly nonexpansive.

Next, we claim that $F(T_r) = EP(\Theta, A)$. Indeed, we have the following:

$$\begin{align*}
u \in F(T_r) &\iff u = T_r u \iff \Theta(u, y) + \langle Au, \eta(y, u) \rangle + f(y) - f(u) \\
&\iff \frac{1}{r} \langle u - y, Au - Jx \rangle \geq 0, \quad \forall y \in K \iff \Theta(u, y) + \langle Au, \eta(y, u) \rangle \\
&\iff \frac{1}{r} \langle u - y, Au - Jx \rangle + f(y) - f(u) \geq 0, \quad \forall y \in K \iff u \in EP(\Theta, A).
\end{align*}$$

Finally, we prove (4) and (5). Indeed, we can obtain (4) directly from Lemma 2.8 and Lemma 2.9 of [1]. Moreover, since $T_r$ is quasi-$\phi$-nonexpansive, one sees that $T_r$ is closed and convex from Lemma 5. Therefore, $EP(\Theta, A)$ is also closed and convex. This completes the proof. \qed
Remark 13. In (42), if \( A(x) \equiv 0 \) for all \( x \in K \), then the equilibrium problem (42) is reduced to the equilibrium problem in [20] and if \( \eta(y, x) = y - x \) for all \( x, y \in K \), then the equilibrium problem (42) is reduced to the equilibrium problem in [21].

In the following, we give the main result of this paper.

**Theorem 14.** Let \( K \) be a nonempty closed convex bounded subset of a uniformly convex, uniformly smooth Banach space \( E \) with the dual space \( E^* \). Let \( A : K \to E^* \) be an \( \eta \)-hemicontinuous and relaxed \( \eta \)-monotone mapping, let \( \Theta \) be a bifunction from \( K \times K \) to \( \mathbb{R} \) satisfying (A1)–(A4), and let \( f \) be a proper convex and lower semicontinuous function from \( K \times K \) to \( \mathbb{R} \cup \{+\infty\} \). Let \( S : E \to E \) be a closed quasi-\( \phi \)-nonexpansive mapping such that \( F = F(S) \cap \text{EP}(\Theta, A) \neq \emptyset \). Assume that the conditions (i)–(v), Lemma 12, and the following condition hold:

\[
\lim\sup_{t \downarrow 0} \langle Az, \eta(x, ty + (1-t)w) \rangle \leq \langle Az, \eta(x, w) \rangle. \tag{67}
\]

where \( J \) is the duality mapping on \( E \), \( \{\alpha_n\} \subset (0, 1) \) with \( 0 < \liminf_{n \to \infty} \alpha_n (1 - \alpha_n) \), and \( \{r_n\} \subset (r, \infty) \) with \( r > 0 \). Then the sequence \( \{x_n\} \) generated by (52) converges strongly to \( \Pi_{F(S)}x \).

Proof. First, since the inequality \( \phi(z, u_n) \leq \phi(z, x_n) \) is equivalent to the following:

\[
2 \left( \langle z, Jx_n \rangle - \langle z, Ju_n \rangle \right) \leq \|x_n\|^2 - \|u_n\|^2, \tag{61}
\]

\( C_n \) is closed and convex for all \( n \geq 1 \). It follows from the definition of \( D_n \) that \( D_n \) is also closed and convex for all \( n \geq 1 \).

On the other hand, since every \( T_{r_n} \) is quasi-\( \phi \)-nonexpansive, according to Lemma 12 (4), we have, for any \( w \in F \),

\[
\phi(w, u_n) = \phi(w, T_{r_n}y_n) \\
\leq \phi(w, y_n) \\
= \phi(w, f^{-1}(\alpha_n Jx_n + (1 - \alpha_n) JSx_n)) \\
= \|w\|^2 - 2\alpha_n \langle w, Jx_n \rangle - 2(1 - \alpha_n) \langle w, JSx_n \rangle + \alpha_n \|x_n\|^2 + (1 - \alpha_n) \|JSx_n\|^2 \\
\leq \|w\|^2 - 2\alpha_n \langle w, Jx_n \rangle - 2(1 - \alpha_n) \langle w, JSx_n \rangle + \alpha_n \|x_n\|^2 + (1 - \alpha_n) \|x_n\|^2 \\
= \alpha_n \phi(w, x_n) + (1 - \alpha_n) \phi(w, x_n) \\
\leq \alpha_n \phi(w, x_n) + (1 - \alpha_n) \phi(w, x_n) \\
= \phi(w, x_n), \tag{62}
\]

which shows that \( w \in C_n \) for all \( n \geq 1 \). This implies that \( F \subset C_n \) for all \( n \geq 1 \). The definition of \( D_n \) shows that \( F \subset D_n \) for all \( n \geq 1 \). Hence, the sequence \( \{x_n\} \) generated by the algorithm (60) is well defined.

Note that \( D_n \subset D_{n-1} \) for all \( n \geq 1 \). Hence, by \( x_{n+1} = \Pi_{D_n} x \in D_n \subset D_{n-1} \) and \( x_n = \Pi_{D_{n-1}} x \), we have

\[
\phi(x_n, x) \leq \phi(x_{n+1}, x), \quad \forall n \geq 1. \tag{63}
\]

Therefore, \( \{\phi(x_n, x)\} \) is nondecreasing. Since \( \{x_n\} \subset K \), \( \{\phi(x_n, x)\} \) is bounded. It follows that the limit of \( \{\phi(x_n, x)\} \) exists.

Let \( m, n \in \mathbb{N} \) with \( m > n \). Since \( x_m = \Pi_{D_{m-1}} x \in D_{m-1} \subset D_{n-1} \), from Lemma 4 it follows that

\[
\phi(x_m, x_n) = \phi(x_m, \Pi_{D_{n-1}} x) \leq \phi(x_m, x) \\
- \phi(\Pi_{D_{n-1}} x, x) = \phi(x_m, x) - \phi(x_n, x). \tag{64}
\]

Letting \( n \to \infty \) in (64), it follows that \( \phi(x_m, x_n) \to 0 \). It follows from Lemma 2 that \( \|x_m - x_n\| \to 0 \) as \( m, n \to \infty \). Hence \( \{x_n\} \) is a Cauchy sequence. There exists a point \( x^* \in K \) such that \( x_n \to x^* \) as \( n \to \infty \).

Next, we show that \( x^* \in F(S) \). By taking \( \rho = 1 \) in (64), one arrives at

\[
\lim_{n \to \infty} \phi(x_{n+1}, x_n) = 0. \tag{65}
\]

From Lemma 2, it follows that

\[
\lim_{n \to \infty} \|x_{n+1} - x_n\| = 0. \tag{66}
\]

Noticing that \( x_{n+1} \in D_n \subset C_n \) for all \( n \geq 1 \), we obtain

\[
\phi(x_{n+1}, u_n) \leq \phi(x_{n+1}, x_n). \tag{67}
\]
Thus, it follows from (65) that
\[
\lim_{n \to \infty} \phi(x_{n+1}, u_n) = 0. \tag{68}
\]
It follows from Lemma 2 that
\[
\lim_{n \to \infty} \|x_{n+1} - u_n\| = 0. \tag{69}
\]
Combining (66) with (69), one has
\[
\lim_{n \to \infty} \|x_n - u_n\| = 0. \tag{70}
\]
Since \(x_n \to x^*\) as \(n \to \infty\), we have
\[
u_n \to x^* \quad (n \to \infty). \tag{71}
\]
On the other hand, since \(J\) is uniformly norm-to-norm continuous on bounded sets, one has
\[
\lim_{n \to \infty} \|Jx_n - Ju_n\| = 0. \tag{72}
\]
Since \(E\) is a uniformly smooth Banach space, one knows that \(E^*\) is a uniformly convex Banach space. Let \(r = \sup_{x \in E} \{\|x_n\|, \|Sx_n\|\}\). It follows from Lemma 6 that, for any \(w \in F\),
\[
\phi(w, u_n) = \phi(w, T_n y_n)
\leq \phi(w, y_n)
= \phi(w, J^{-1}(\alpha_n Jx_n + (1 - \alpha_n) JSx_n))
= \|w\|^2 - 2\alpha_n \langle w, Jx_n \rangle - 2(1 - \alpha_n) \langle w, JSx_n \rangle
+ \alpha_n \|Jx_n\|^2 + (1 - \alpha_n) \|JSx_n\|^2
\geq \|w\|^2 - 2\alpha_n \langle w, Jx_n \rangle - 2(1 - \alpha_n) \langle w, JSx_n \rangle
+ \alpha_n \|Jx_n\|^2 + (1 - \alpha_n) \|JSx_n\|^2
- \alpha_n (1 - \alpha_n) g(\|JSx_n - Jx_n\|)
= \alpha_n \phi(w, x_n) + (1 - \alpha_n) \phi(w, Sx_n)
- \alpha_n (1 - \alpha_n) g(\|JSx_n - Jx_n\|)
\leq \phi(w, x_n) - \alpha_n (1 - \alpha_n) g(\|JSx_n - Jx_n\|). \tag{73}
\]
It follows that
\[
\alpha_n (1 - \alpha_n) g(\|JSx_n - Jx_n\|) \leq \phi(w, x_n) - \phi(w, u_n). \tag{74}
\]
On the other hand, one has
\[
\phi(w, x_n) - \phi(w, u_n) = \|x_n\|^2 - \|u_n\|^2 - 2 \langle w, Jx_n - Ju_n \rangle
\leq \|x_n - u_n\| (\|x_n\| + \|u_n\|)
+ 2 \|w\| \|Jx_n - Ju_n\|. \tag{75}
\]
Thus, it follows from (70) and (72) that
\[
\phi(w, x_n) - \phi(w, u_n) \longrightarrow 0 \quad (n \to \infty). \tag{76}
\]
Noting that \(0 < \lim inf_{n \to \infty} \alpha_n(1 - \alpha_n)\) and using (74) and (76), we get
\[
g(\|Jx_n - JSx_n\|) \longrightarrow 0 \quad (n \to \infty). \tag{77}
\]
It follows from the continuity of \(g\) that
\[
\|Jx_n - JSx_n\| \longrightarrow 0 \quad (n \to \infty). \tag{78}
\]
Since \(J^{-1}\) is also uniformly norm-to-norm continuous on bounded sets, one gets
\[
\lim_{n \to \infty} \|x_n - Sx_n\| = 0. \tag{79}
\]
From the closeness of \(S\), we can conclude that \(x^* \in F(S)\).
Next, we show that \(x^* \in EP(\Theta, A)\). From (62), we arrived at
\[
\phi(w, y_n) \leq \phi(w, x_n). \tag{80}
\]
From \(u_n = T_n y_n\) and Lemma 12 (4), one has
\[
\phi(u_n, y_n) = \phi(T_n y_n, y_n)
\leq \phi(w, y_n) - \phi(w, T_n y_n)
\leq \phi(w, x_n) - \phi(w, u_n).
\]
Thus, it follows from (76) that
\[
\phi(u_n, y_n) \longrightarrow 0 \quad (n \to \infty). \tag{82}
\]
From Lemma 2, we get
\[
\|u_n - y_n\| \longrightarrow 0 \quad (n \to \infty). \tag{83}
\]
Noting that \(u_n = T_n y_n\), one obtains
\[
\Theta(u_n, y) + \langle Au_n, \eta(y, u_n) \rangle + f(y) - f(u_n)
+ \frac{1}{r_n} \langle y - u_n, Ju_n - Ju_n \rangle \geq 0, \quad \forall y \in K. \tag{84}
\]
From (A4) and (i), it follows that
\[
\frac{1}{r_n} \|y - u_n\| \|Ju_n - Ju_n\|
\geq \langle Au_n, \eta(u_n, y) \rangle + f(u_n) - f(y) - \Theta(u_n, y)
\geq \langle Au_n, \eta(u_n, y) \rangle + f(u_n) - f(y) + \Theta(y, u_n), \quad \forall y \in K. \tag{85}
\]
Since \(J\) is uniformly norm-to-norm continuous on bounded sets, one has
\[
\lim_{n \to \infty} \|Ju_n - Ju_n\| = 0. \tag{86}
\]
Noticing that $r_n \geq r > 0$ for all $n \geq 1$, it follows from (A4), (ii), (85), and (86) that
\[ 0 \geq \langle Ax^*, \eta(x^*, y) \rangle + f(x^*) - f(y) + \Theta(y, x^*), \]
\[ \forall y \in K. \] (87)

For all $0 < t \leq 1$ and $y \in K$, define $y_t = ty + (1-t)x^*$. Noticing that $x^*, y \in K$, one obtains $y_t \in K$, which yields that
\[ 0 \geq \langle Ax^*, \eta(x^*, y_t) \rangle + f(x^*) - f(y_t) + \Theta(y_t, x^*). \] (88)

It follows from (A1), (A4), (i), (ii), the convexity of $f$, and (88) that
\[ 0 = \Theta(y_t, y_t) + \langle Ax^*, \eta(y_t, y_t) \rangle + f(y_t) - f(y_t) \]
\[ \leq t [\Theta(y, y) + \langle Ax^*, \eta(y, y_t) \rangle + f(y) - f(y_t)] \]
\[ + (1-t) [\Theta(y, x^*) + \langle Ax^*, \eta(y, y_t) \rangle + f(x^*) - f(y_t)] \]
\[ \leq t [\Theta(y, y) + \langle Ax^*, \eta(y, y_t) \rangle + f(y) - f(y_t)]; \]
that is,
\[ \Theta(y, y) + \langle Ax^*, \eta(y, y_t) \rangle + f(y) - f(y_t) \geq 0. \] (90)

Letting $t \downarrow 0$, it follows from (A3), (vi), and the lower semicontinuity of $f$ that
\[ \Theta(x^*, y) + \langle Ax^*, \eta(y, y_t) \rangle + f(y) - f(x^*) \geq 0, \]
\[ \forall y \in K. \] (91)

This implies that $x^* \in EP(\Theta, A)$.

Finally, we prove $x^* = \Pi_F x$. From $x_{n+1} = \Pi_{D_n} x$, we see that
\[ \langle x_{n+1} - z, Jx - Jx_{n+1} \rangle \geq 0, \quad \forall z \in D_n. \] (92)

Since $F \subset D_n$ for each $n \geq 1$, we have
\[ \langle x_{n+1} - w, Jx - Jx_{n+1} \rangle \geq 0, \quad \forall w \in F. \] (93)

By taking the limit in (93), one has
\[ \langle x^* - w, Jx - Jx^* \rangle \geq 0, \quad \forall w \in F. \] (94)

At this point, in view of Lemma 3, one sees that $x^* = \Pi_F x$. This completes the proof. \[ \square \]

If $\Theta \equiv 0$ in Theorem 14, then we have the following result.

**Corollary 15.** Let $K$ be a nonempty closed convex bounded subset of a uniformly convex, uniformly smooth Banach space $E$ with the dual space $E^*$. Let $\Theta : K \times K \to \mathbb{R}$ be an $\eta$-hemiconvex and relaxed $\eta$-$\alpha$-monotone mapping and let $f$ be a proper convex and lower semicontinuous function from $K \times K$ to $\mathbb{R} \cup \{+\infty\}$. Let $S : E \to E$ be a closed quasi-$\phi$-nonexpansive mapping such that $F = F(S) \cap \Omega \neq \emptyset$. Assume that the conditions (i)–(v), Lemma 12, and the following condition hold:
\[ (vi) \text{ for all } x, y, z, p \in K, \]
\[ \lim\sup_{t \downarrow 0} \langle Az, \eta(x, ty + (1 - t)p) \rangle \leq \langle Az, \eta(x, p) \rangle. \] (95)

Let $\{x_n\}$ be a sequence in $K$ generated by the following manner:
\[ x_1 = x \in K \text{ chosen arbitrarily}, \]
\[ y_n = J^{-1} \left( \alpha_n Jx_n + (1 - \alpha_n) JSx_n \right), \]
\[ u_n \in K \text{ such that } \langle Au_n, \eta(y_n, u_n) \rangle + f(y_n) - f(u_n) \geq 0, \quad \forall y \in K, \]
\[ C_n = \{ z \in K : \psi(z, u_n) \leq \psi(z, x_n) \}, \]
\[ D_n = \bigcap_{i=1}^{n} C_i, \]
\[ x_{n+1} = \Pi_{D_n} x, \quad \forall n \geq 1, \] (96)

where $J$ is the duality mapping on $E$, $\{\alpha_n\} \subset (0, 1)$ with $0 < \liminf_{n \to \infty} \alpha_n (1 - \alpha_n)$, and $\{x_n\} \subset (r, \infty)$ with $r > 0$. Then the sequence $\{x_n\}$ generated by (96) converges strongly to $\Pi_F x$.

If $A \equiv 0$ and $f \equiv 0$ in Theorem 14, then we have following.

**Corollary 16.** Let $K$ be a nonempty closed convex subset of a uniformly convex, uniformly smooth Banach space $E$ with the dual space $E^*$. Let $\Theta$ be a bifunction from $K \times K$ to $\mathbb{R}$ satisfying (A1)–(A4) and let $S : E \to E$ be a closed quasi-$\phi$-nonexpansive mapping such that $F = F(S) \cap EP(\Theta) \neq \emptyset$. Let $\{x_n\}$ be a sequence generated by the following manner:
\[ x_1 = x \in E \text{ chosen arbitrarily}, \]
\[ y_n = J^{-1} \left( \alpha_n Jx_n + (1 - \alpha_n) JSx_n \right), \]
\[ u_n \in K \text{ such that } \Theta(u_n, y) \]
\[ + \frac{1}{r_n} \left( y - u_n, Jx - Jy_n \right) \geq 0, \quad \forall y \in K, \]
\[ C_n = \{ z \in E : \psi(z, u_n) \leq \psi(z, x_n) \}, \]
\[ D_n = \bigcap_{i=1}^{n} C_i, \]
\[ x_{n+1} = \Pi_{D_n} x, \quad \forall n \geq 1, \] (97)

where $J$ is the duality mapping on $E$, $\{\alpha_n\} \subset (0, 1)$ with $0 < \liminf_{n \to \infty} \alpha_n (1 - \alpha_n)$, and $\{x_n\} \subset (r, \infty)$ with $r > 0$. Then the sequence $\{x_n\}$ generated by (97) converges strongly to $\Pi_F x$. 

Remark 17. Theorem 14 improves the corresponding ones of Wang et al. [7] from Hilbert spaces to Banach spaces and those of Takahashi and Zembayashi [1] from relative nonexpansive mapping to quasi-$\phi$-nonexpansive mapping.
