We advise that the proof of Theorem 12 given by Borcut et al. (2014) is not correct, and it cannot be corrected using the same technique. Furthermore, we present some similar results as an approximation to the opened question if that statement is valid.

1. Introduction

The definition of coupled fixed point was firstly given by Guo and Lakshmikantham in [1]. This concept, in the context of metric space, was reconsidered by Gnana Bhaskar and Lakshmikantham [2] in 2006 and by Lakshmikantham and Ciric [3] in the coincidence case. Later, Karapınar investigated this notion in the context of cone metric space. After that, Berinde and Borcut [4] presented the notion of triped fixed point obtaining similar results, and the same authors extended their work to the coincidence case in [5] (see also, e.g., [6–9]).

A coupled fixed point of \( F : X \times X \to X \) is a point \( (x, y) \in X^2 \) such that \( F(x, y) = x \) and \( F(y, x) = y \). In order to ensure existence and uniqueness of coupled fixed points, Bhaskar and Lakshmikantham introduced the concept of mapping having the mixed monotone property. Henceforth, let \( \preceq \) be a partial order on \( X \). The mapping \( F \) is said to have the mixed monotone property (with respect to \( \preceq \)) if \( F(x, y, z) \) is monotone nondecreasing in \( x \) and \( z \), and it is monotone nonincreasing in \( y \); that is, for any \( x, y, z \in X \),

\[
\begin{align*}
x_1, x_2 \in X, \quad x_1 \preceq x_2 \Rightarrow & F(x_1, y, z) \preceq F(x_2, y, z), \\
y_1, y_2 \in X, \quad y_1 \preceq y_2 \Rightarrow & F(x, y_1, z) \succeq F(x, y_2, z).
\end{align*}
\]

(1)

Inspired by the previous notions, Berinde and Borcut defined the concepts of triped fixed point and mixed monotone property as follows. A triped fixed point of \( F : X \times X \times X \to X \) is a point \( (x, y, z) \in X^3 \) such that \( F(x, y, z) = x \), \( F(y, x, y) = y \), and \( F(z, y, z) = z \). The mapping \( F \) is said to have the mixed monotone property (with respect to \( \preceq \)) if \( F(x, y, z) \) is monotone nondecreasing in \( x \) and \( z \), and it is monotone nonincreasing in \( y \); that is, for any \( x, y, z \in X \),

\[
\begin{align*}
x_1, x_2 \in X, \quad x_1 \preceq x_2 \Rightarrow & F(x_1, y, z) \preceq F(x_2, y, z), \\
y_1, y_2 \in X, \quad y_1 \preceq y_2 \Rightarrow & F(x, y_1, z) \succeq F(x, y_2, z), \\
y_1, y_2 \in X, \quad y_1 \preceq y_2 \Rightarrow & F(x, y, z_1) \preceq F(x, y, z_2).
\end{align*}
\]

(2)

The second equation that defines a triped fixed point, that is, \( F(y, x, y) = y \), uses the point \( y \) twice in the arguments of \( F \). This fact is necessary to ensure the existence of triped fixed points of a nonlinear contraction because, in such a case, the mixed monotone property is applicable.

Very recently, as a continuation of their pioneering works in the triped case, Borcut et al. announced in [10] the following result.
Theorem 1 (Borcut et al. [10], Theorem 12). Let \((X, \preceq)\) be a partially ordered set and suppose there is a metric \(d\) on \(X\) such that \((X, d)\) is a complete metric space. Let \(F : X^3 \to X\) be a mapping having the mixed monotone property on \(X\). Assume that there exists a \(k \in [0, 1)\) such that

\[
d(F(x, y, z), F(u, v, w)) \\
\leq k \left[ d(x, F(x, y, z)) + d(y, F(y, x, y)) + d(z, F(z, y, x)) + d(u, F(u, v, w)) + d(v, F(v, u, v)) + d(w, F(w, v, u)) \right]
\]

for all \(x \succeq u, y \preceq v, z \succeq w\). Also suppose that either

(a) \(F\) is continuous, or

(b) \(X\) has the following properties:

(i) if a nondecreasing sequence \(\{x_m\} \to x\), then \(x_m \preceq x\) for all \(m\);

(ii) if a nonincreasing sequence \(\{y_m\} \to y\), then \(y_m \succeq y\) for all \(m\).

If there exist \(x_0, y_0, z_0 \in X\) such that

\[
x_0 \preceq F(x_0, y_0, z_0), \quad y_0 \succeq F(y_0, x_0, y_0), \quad z_0 \preceq F(z_0, y_0, x_0),
\]

then \(F\) has a tripled fixed point in \(X\); that is, there exist \(x, y, z \in X\) such that

\[
F(x, y, z) = x, \quad F(y, x, y) = y, \quad F(z, y, x) = z.
\]

This note is to advise that the proof given by the authors of the previous result is not correct, and it cannot be corrected using the same technique. Furthermore, we present some similar results as an approximation to the opened question if the previous theorem is valid.

2. A Review of the Incorrect Proof

Let us review the lines of their proof. Based on \(x_0, y_0, z_0 \in X\), the authors defined, recursively, for all \(n \geq 0\),

\[
x_{n+1} = F(x_n, y_n, z_n), \quad y_{n+1} = F(y_n, x_n, y_n), \quad z_{n+1} = F(z_n, y_n, x_n),
\]

and they proved that \(\{x_n\}\) and \(\{z_n\}\) were monotone nondecreasing sequences and \(\{y_n\}\) was a monotone nonincreasing sequence in \((X, \preceq)\). Then, they defined, for all \(n \in \mathbb{N}\),

\[
D_{x_{n+1}} = d(x_{n+1}, x_n), \quad D_{y_{n+1}} = d(y_{n+1}, y_n), \quad D_{z_{n+1}} = d(z_{n+1}, z_n),
\]

Using the contractivity condition (3), they proved that, taking into account that \(x_0 \succ x_0, y_0 \succeq y_0, z_0 \preceq z_0\),

\[
D_{x_{n+1}} = d(x_{n+1}, x_n) = d(F(x_n, y_n, z_n), F(x_{n-1}, y_{n-1}, z_{n-1})) \\
\leq \frac{k}{8} \left[ d(x_n, F(x_n, y_n, z_n)) + d(y_n, F(y_n, x_n, y_n)) + d(z_n, F(z_n, y_n, x_n)) + d(y_{n-1}, F(y_{n-1}, x_{n-1}, y_{n-1})) + d(y_{n-1}, F(y_{n-1}, x_{n-1}, y_{n-1})) + d(z_{n-1}, F(z_{n-1}, y_{n-1}, x_{n-1})) \right]
\]

for all \(x_0 \succeq u, y_0 \preceq v, z_0 \preceq w\). Also suppose that either

(a) \(F\) is continuous, or

(b) \(X\) has the following properties:

(i) if a nondecreasing sequence \(\{x_m\} \to x\), then \(x_m \preceq x\) for all \(m\);

(ii) if a nonincreasing sequence \(\{y_m\} \to y\), then \(y_m \succeq y\) for all \(m\).

If there exist \(x_0, y_0, z_0 \in X\) such that

\[
x_0 \preceq F(x_0, y_0, z_0), \quad y_0 \succeq F(y_0, x_0, y_0), \quad z_0 \preceq F(z_0, y_0, x_0),
\]

then \(F\) has a tripled fixed point in \(X\); that is, there exist \(x, y, z \in X\) such that

\[
F(x, y, z) = x, \quad F(y, x, y) = y, \quad F(z, y, x) = z.
\]

Based on this inequality, the authors immediately announced that

\[
D_{y_{n+1}} \leq \frac{k}{8} \left[ D_{x_n} + 2D_{y_n} + D_{x_{n+1}} + 2D_{y_{n+1}} \right], \quad (9)
\]

\[
D_{z_{n+1}} \leq \frac{k}{8} \left[ D_{x_n} + D_{y_n} + D_{z_n} + D_{x_{n+1}} + D_{y_{n+1}} + D_{z_{n+1}} \right], \quad (10)
\]

(see [10, page 4, inequalities (2.4) and (2.5)]). However, these last two inequalities are false. In fact, we can only prove that

\[
D_{y_{n+1}} = d(y_{n+1}, y_n) = d(F(y_n, x_n, y_n), F(x_{n-1}, x_{n-1}, y_{n-1})) \\
\leq \frac{k}{8} \left[ d(y_n, F(y_n, x_n, y_n)) + d(x_n, F(x_n, y_n, x_n)) + d(y_n, F(y_n, x_n, y_n)) + d(y_{n-1}, F(y_{n-1}, x_{n-1}, y_{n-1})) + d(x_{n-1}, F(x_{n-1}, y_{n-1}, x_{n-1})) + d(y_{n-1}, F(y_{n-1}, x_{n-1}, y_{n-1})) \right]
\]

\[
\leq \frac{k}{8} \left[ 2d(y_n, y_{n+1}) + d(x_n, F(x_n, y_{n+1}, x_{n+1})) + 2d(y_{n-1}, y_n) + d(x_{n-1}, F(x_{n-1}, y_{n-1}, x_{n-1})) \right]
\]

\[
\leq \frac{k}{8} \left[ 2D_{y_{n+1}} + d(x_n, F(x_n, y_{n+1}, x_{n+1})) + 2D_{y_n} + d(x_{n-1}, F(x_{n-1}, y_{n-1}, x_{n-1})) \right]. \quad (11)
\]

However, comparing (9) with (11), we notice that \(D_{x_{n+1}} = d(x_{n+1}, x_n) = d(F(x_n, y_n, z_n))\) does not necessarily coincide with \(d(x_n, F(x_n, y_n, x_n))\) and, similarly, \(D_{x_n} = d(x_n, F(x_n, y_n, x_n))\) is not necessarily equal to
Therefore, inequality (9) cannot be ensured.

Exactly in the same way, it can be possible to see that (10) cannot be proved using the contractivity condition (3). In such a case, the proof given by the authors, which decisively used inequalities (9) and (10), is false.

3. Some Berinde and Borcut’s Type Tripled Fixed Point Theorems

For the moment, the question about whether Theorem 1 is valid is opened. The following results are some approximations to this problem, using contractivity conditions that are inspired in (3). The main aim of this section is to show some results in this line of research using a well-known result by Ćirić in 1972 (see [11]) in the case of metric spaces that were not necessarily partially ordered. A partially ordered version can be found, for example, in [19]. Our main results will be consequences of the next result.

Theorem 4 (see e.g., [19]). Let \((X, \preceq)\) be a partially ordered set and suppose that there is a metric \(d\) on \(X\) such that \((X,d)\) is a complete metric space. Let \(T : X \to X\) be a nondecreasing mapping and let \(k \in [0,1)\) be such that

\[
d (Tx, Ty) \leq k \max \left( \frac{d (x, y) + d (x, Tx) + d (y, Ty)}{2} \right)
\]

for all \(x, y \in X\) such that \(x \preceq y\). Also assume that \(F\) is continuous or \((X,d,\preceq)\) is regular. If there exist \(x_0 \in X\) such that \(x_0 \not\preceq Tx_0\), then \(F\) has a fixed point.

In the following result, we found some terms that play an important role in the contractivity condition (3).

Theorem 5. Let \((X, \preceq)\) be a partially ordered set and suppose there is a metric \(d\) on \(X\) such that \((X,d)\) is a complete metric space. Let \(F : X^3 \to X\) be a mapping having the mixed monotone property on \(X\). Suppose that there exists \(k \in [0,1)\) such that

\[
d (F(x, y, z), F(u, v, w))
\]

\[
\leq \frac{k}{4} \max \left( d (x, u) + d (y, v) + d (z, w),
\right.
\]

\[
\left. d (x, F(x, y, z)) + d (z, F(z, y, x)),
\right.
\]

\[
\left. d (u, F(u, v, w)) + d (v, F(w, v, u)),
\right.
\]

\[
\left. d (u, F(x, y, z)) + d (w, F(z, y, x))
\right)
\]

\[
\times (2)^{-1}
\]

for all \(x, y, z, u, v, w \in X\) such that \(x \preceq u, y \succeq v, \) and \(z \preceq w\). Also assume that \(F\) is continuous or \((X,d,\preceq)\) is regular. If there exist \(x_0, y_0, z_0 \in X\) such that

\[
x_0 \preceq F(x_0, y_0, z_0), \quad y_0 \succeq F(y_0, x_0, y_0),
\]

\[
z_0 \preceq F(z_0, y_0, x_0),
\]

then \(F\) has a tripled fixed point in \(X\); that is, there exist \(x, y, z \in X\) such that

\[
F (x, y, z) = x, \quad F (y, x, y) = y, \quad F (z, y, x) = z.
\]
Proof. As $F$ has the mixed monotone property on $X$ with respect to $\preceq$, it follows that $T^3_F$ is $\preceq$-nondecreasing. Let us define, for all $x, y, z, u, v, w \in X$,

\[
M ((x, y, z), (u, v, w)) = \max (d^3 ((x, y, z), (u, v, w)), \\
T^3_F((x, y, z)), \\
T^3_F((u, v, w)), \\
\left( d^3 ((x, y, z), T^3_F(x, y, z)) + d^3 ((u, v, w), T^3_F(u, v, w)) \right) \times (2)^{-1})
\]

\[
= \max (d(x, u) + d(y, v) + d(z, w), d(x, F(x, y, z)) + d(y, F(y, x, y)) + d(z, F(z, y, x)), \\
d(u, F(u, v, w)) + d(v, F(u, v, w)) + d(w, F(v, u, v)), \\
(d(x, F(x, w, u)) + d(y, F(v, w, u)), \\
+ d(z, F(v, u, w)) + d(u, F(x, y, z)) + d(v, F(x, y, z)) + d(w, F(z, y, x)) \times (2)^{-1})
\]

Assume that $x \preceq u$, $y \succeq v$, and $z \preceq w$; that is, $(x, y, z) \sqsubseteq (u, v, w)$. In this case, the contractivity condition (16) guarantees that

\[
d(F(x, y, z), F(u, v, w)) \leq \frac{k}{4} \max (d(x, u) + d(y, v) + d(z, w), \\
d(x, F(x, y, z)) + d(y, F(y, x, y)) + d(z, F(z, y, x)), \\
d(u, F(u, v, w)) + d(v, F(u, v, w)) + d(w, F(v, u, v)), \\
(d(u, F(x, y, z)) + d(w, F(z, y, x)) + d(x, F(u, v, w)) + d(z, F(w, u, v)) \times (2)^{-1})
\]

\[
\leq \frac{k}{4} M ((x, y, z), (u, v, w)).
\]  

Taking into account that $z \preceq w$, $y \succeq v$, and $x \preceq u$, we also find the same upper bound:

\[
d(F(z, y, x), F(w, v, u)) \leq \frac{k}{4} \max (d(z, w) + d(y, v) + d(x, u), \\
d(z, F(z, y, x)) + d(x, F(x, y, z)), \\
d(v, F(u, v, u)) + d(u, F(u, v, w)), \\
(d(w, F(z, y, x)) + d(u, F(x, y, z)) + d(z, F(x, y, z)) + d(u, F(u, v, w))) \times (2)^{-1}
\]

\[
\leq \frac{k}{4} M ((x, y, z), (u, v, w)).
\]

Furthermore, as $v \preceq y$, $u \succeq x$, and $v \preceq y$,

\[
d(F(y, x, y), F(v, u, v)) \leq \frac{k}{4} \max (d(y, v) + d(x, u) + d(y, v), \\
d(y, F(y, x, y)) + d(y, F(y, x, y)), \\
d(v, F(v, u, v)) + d(v, F(v, u, v)), \\
(d(v, F(y, x, y)) + d(v, F(y, x, y)) + d(y, F(v, u, v))) \times (2)^{-1}
\]

\[
= \frac{k}{4} \max (d(x, u) + 2d(y, v), \\
2d(y, F(y, x, y)) + 2d(v, F(v, u, v)), \\
d(v, F(y, x, y)) + d(y, F(v, u, v)), \\
\leq \frac{k}{4} M ((x, y, z), (u, v, w)) = \frac{k}{2} M ((x, y, z), (u, v, w)).
\]

Joining the last three inequalities, we deduce that, for all $(x, y, z), (u, v, w) \in X^3$ such that $(x, y, z) \sqsubseteq (u, v, w),

\[
d^3(T^3_F(x, y, z), T^3_F(u, v, w)) = d^3(F(x, y, z), F(y, x, y), F(z, y, x))
\]

(21)
(\(F(u, v, w), F(v, u, v), F(w, v, u)\))

\[= d(F(x, y, z), F(u, v, w)) + d\left(\frac{k}{4} + \frac{k}{4} + \frac{k}{2}\right) M((x, y, z), (u, v, w))\]

\[= k M((x, y, z), (u, v, w)).\]  

(23)

As \((x_0, y_0, z_0) \subseteq T^3_F(x_0, y_0, z_0)\), Theorem 4 guarantees that \(T^3_F\) has a fixed point; that is, \(F\) has a tripled fixed point.

**Theorem 6.** Let \((X, \preceq)\) be a partially ordered set and suppose that there is a metric \(d\) on \(X\) such that \((X, d)\) is a complete metric space. Let \(F : X^3 \rightarrow X\) be a mapping having the mixed monotone property on \(X\). Suppose that there exists \(k \in [0, 1)\) such that

\[d(F(x, y, z), F(u, v, w)) \leq k \max\{d(x, F(x, y, z)), d(z, F(z, y, x))\},\]

\[d(u, F(u, v, w)), d(w, F(v, u, w))\}

for all \(x, y, z, u, v, w \in X\) such that \(x \preceq u, y \succeq v,\) and \(z \preceq w\).

Also assume that \(F\) is continuous or \((X, d, \preceq)\) is regular. If there exist \(x_0, y_0, z_0 \in X\) such that

\[x_0 \preceq F(x_0, y_0, z_0), \quad y_0 \succeq F(y_0, x_0, y_0),\]

\[z_0 \preceq F(z_0, y_0, x_0),\]

then \(F\) has a tripled fixed point in \(X\); that is, there exist \(x, y, z \in X\) such that

\[F(x, y, z) = x, \quad F(y, x, y) = y, \quad F(z, y, x) = z.\]  

(26)

**Proof.** Following the lines of the previous proof, consider \(X^3\) provided with the metric \(d^m\). Assume that \(x \preceq u, y \succeq v,\) and \(z \preceq w\); that is, \((x, y, z) \subseteq (u, v, w)\). In this case, the contractivity condition (24) guarantees that

\[d(F(x, y, z), F(u, v, w)) \leq k \max\{d(x, F(x, y, z)), d(z, F(z, y, x))\},\]

\[d(u, F(u, v, w)), d(w, F(v, u, w))\}

and the same upper bound is valid for \(d(F(z, y, x), F(w, v, u))\). Moreover, as \(v \preceq y, u \succeq x,\) and \(v \preceq y,\)

\[d(F(v, u, v), F(y, x, y)) \leq k \max\{d(v, F(v, u, v)), d(y, F(y, x, y))\}.\]  

(28)

Therefore

\[d^m(T^3_F(x, y, z), T^3_F(u, v, w))\]

\[= d^m(F(x, y, z), F(y, x, y), F(z, y, x)),\]

\[(F(u, v, w), F(v, u, v), F(w, v, u))\]

\[= \max\{d(F(x, y, z), F(u, v, w)), d(F(y, x, y), F(v, u, v)), d(F(z, y, x), F(w, v, u))\}\]

\[\leq k \max\{d(x, F(x, y, z)), d(y, F(y, x, y)), d(z, F(z, y, x))\},\]

\[d(u, F(u, v, w)), d(w, F(v, u, w))\}

\[= k \max\{d^m((x, y, z), T^3_F(x, y, z)), d((u, v, w), T^3_F(u, v, w))\}.

Theorem 4 guarantees that \(T^3_F\) has a fixed point; that is, \(F\) has a tripled fixed point.

The following particularization is also inspired by some Berinde and Borcut’s results.

**Corollary 7.** Let \((X, \preceq)\) be a partially ordered set and suppose that there is a metric \(d\) on \(X\) such that \((X, d)\) is a complete metric space. Let \(F : X^3 \rightarrow X\) be a mapping having the mixed monotone property on \(X\). Suppose that there exists \(a, b, c, e \in [0, 1)\) such that \(a + b + c + e < 1\) and

\[d(F(x, y, z), F(u, v, w)) \leq ad(x, F(x, y, z)) + bd(z, F(z, y, x))\]

\[+ cd(u, F(u, v, w)) + ed(w, F(w, v, u))\]

for all \(x, y, z, u, v, w \in X\) such that \(x \preceq u, y \succeq v,\) and \(z \preceq w\).

Also assume that \(F\) is continuous or \((X, d, \preceq)\) is regular. If there exist \(x_0, y_0, z_0 \in X\) such that

\[x_0 \preceq F(x_0, y_0, z_0), \quad y_0 \succeq F(y_0, x_0, y_0),\]

\[z_0 \preceq F(z_0, y_0, x_0),\]

then \(F\) has a tripled fixed point in \(X\); that is, there exist \(x, y, z \in X\) such that

\[F(x, y, z) = x, \quad F(y, x, y) = y, \quad F(z, y, x) = z.\]  

(32)
Proof. Let us define \( k = a + b + c + e \in [0, 1) \). If \((x, y, z), (u, v, w) \in X^3\) are such that \((x, y, z) \subseteq (u, v, w)\), then
\[
d(F(x, y, z), F(u, v, w)) \\
\leq ad(x, F(x, y, z)) + bd(z, F(y, x, y)) \\
+ cd(u, F(u, v, w)) + ed(w, F(w, v, u)) \\
\leq (a + b + c + e) \max \{d(F(x, y, z), F(y, x, y)), d(u, F(u, v, w)), d(w, F(w, v, u))\},
\]
so the previous theorem is applicable.

The following theorem presents a contractivity condition more similar to (3) than (16). It follows from the previous result using \( a = b = c = e = k/4 \).

**Corollary 8.** Let \((X, \preceq)\) be a partially ordered set and suppose that there is a metric \(d\) on \(X\) such that \((X, d)\) is a complete metric space. Let \(F: X^3 \to X\) be a mapping having the mixed monotone property on \(X\). Suppose that there exists \(k \in [0, 1)\) such that
\[
d(F(x, y, z), F(u, v, w)) \\
\leq \frac{k}{4} \max \{d(F(x, y, z), F(y, x, y)), d(u, F(u, v, w)), d(w, F(w, v, u))\},
\]
for all \(x, y, z, u, v, w \in X\) such that \(x \preceq u, y \succeq v, \) and \(z \preceq w\). Also assume that \(F\) is continuous or \((X, d, \preceq)\) is regular. If there exist \(x_0, y_0, z_0 \in X\) such that
\[
x_0 \preceq F(x_0, y_0, z_0), \quad y_0 \succeq F(y_0, x_0, y_0), \\
z_0 \preceq F(z_0, y_0, x_0),
\]
then \(F\) has a tripled fixed point in \(X\); that is, there exist \(x, y, z \in X\) such that
\[
F(x, y, z) = x, \quad F(y, x, y) = y, \quad F(z, y, x) = z.
\]

**Conflict of Interests**

The authors declare that there is no conflict of interests regarding the publication of this paper.

**Authors’ Contribution**

All authors contributed equally and significantly in writing this paper. All authors read and approved the final paper.

**Acknowledgments**

This research was supported by Deanship of Scientific Research (DSR), King Abdulaziz University, Jeddah, Saudi Arabia. The authors offer thanks to anonymous referees for their remarkable comments, suggestion, and ideas which helped to improve this paper. Antonio-F. Roldán-López-de-Hierro has been partially supported by Junta de Andalucía by Project FQM-268 of the Andalusian CICYE.
