We define the notions of Bosbach states and inf-Bosbach states on a bounded hyper BCK-algebra \((H, \cdot, 0, e)\) and derive some basic properties of them. We construct a quotient hyper BCK-algebra via a regular congruence relation. We also define a \(\ast\)-compatible regular congruence relation \(\theta\) and an \(\ast\)-compatible inf-Bosbach state \(s\) on \((H, \cdot, 0, e)\). By inducing an inf-Bosbach state \(\hat{s}\) on the quotient structure \(H/[0]_{\theta}\), we show that \(H/[0]_{\theta}\) is a bounded commutative BCK-algebra which is categorically equivalent to an MV-algebra. In addition, we introduce the notions of hyper measures (states/measure morphisms/state morphisms) on hyper BCK-algebras, and present a relation between hyper state-morphisms and Bosbach states. Then we construct a quotient hyper BCK-algebra \(H/Ker(m)\) by a reflexive hyper BCK-ideal \(Ker(m)\). Further, we prove that \(H/Ker(m)\) is a bounded commutative BCK-algebra.

1. Introduction

The theory of hyper structures (also called multialgebras) was introduced in 1934 by Marty [1] at the 8th Congress of Scandinavian Mathematicians. Then several researchers have worked on this new field and developed it. Corsini studied the theory of Hypergroups; see [2, 3]. Krasner [4] introduced the notion of hyperrings and hyperfields. Massouros [5] introduced the theory of hypercompositional structures into the theory of automata. Jun et al. [6] introduced the concept of hyper BCK-algebras which is a generalization of BCK-algebras and studied some properties of them. They also introduced the notions of hyper BCK-ideals, weak/strong hyper BCK-ideals, and reflexive hyper BCK-ideals and discussed the relations among these notions. From then on, a lot of literatures about hyper BCK/BCI-algebras appear; see [7–11].

MV-algebras entered mathematics just 50 years ago due to Chang [12], but the notion of states for MV-algebras was introduced by Mundici [13] in 1995 as averaging of the truthvalue in Lukasiewicz logic. BL-algebras were introduced in the 1990s by Hájek as the equivalent algebraic semantics for its basic fuzzy logic. Ciungu et al. [14] defined a state-operator and a strong state-operator for a BL-algebra and proved some basic properties of them. Liu [15] studied the existence of Bosbach states and Riecan states on finite monoidal \(t\)-norm based algebras (MTL-algebra for short) and gave some examples to show that there exist MTL-algebras having no Bosbach states and Riecan states.

Dvurečenskij [16] introduced measures and states on BCK-algebras and showed that the set of elements of measure 0 is an ideal and the corresponding quotient BCK-algebra is commutative with a lifted original measure. Corina Ciungu and Dvurečenskij [17] extended the notions of measures and states, which were presented in the paper of Dvurečenskij and Pulmannová [18] to the case of pseudo-BCK-algebras. They also studied similar properties and proved that the notion of states in the sense of Dvurečenskij and Pulmannová [18] coincides with the Bosbach state.

At present, the state theories were set up in various algebraic structures. So far, we have not found research literatures about the state theory on hyper structures. In this paper, we mainly introduce and study the state theory on hyper BCK-algebras.

The paper is organized as follows. In Section 2, we recall some basic notions and some results of hyper BCK-algebras. Then we induce two new operations \(\land\) and \(\ast\) by the operation \(\ast\) on hyper BCK-algebras and investigate some properties of them. We also present a relation between hyper BCK-algebras and MV-algebras. In Section 3, we define a Bosbach state and an inf-Bosbach state on a bounded hyper BCK-algebra and discuss some of their basic
properties. In Section 4, we study inf-Bosbach states on quotient hyper BCK-algebras. In Section 5, we define hyper measure, hyper states, hyper measure-morphisms, and hyper state-morphisms on hyper BCK-algebras and obtain some interesting results.

2. Preliminaries

In this section, we gather some basic notions and properties relevant to hyper BCK-algebras which we need in the sequel.

Let $H$ be a nonempty set with a hyperoperation $\circ$ and a constant $0$. If $(H, \circ, 0)$ satisfies the following axioms: for all $x, y, z \in H$,

(HK1) $(x \circ z) \circ (y \circ z) \approx x \circ y$,
(HK2) $(x \circ y) \circ z = (x \circ z) \circ y$,
(HK3) $x \circ \{ y \} \approx \{ x \}$,
(HK4) $x \approx y$ and $y \approx x$ imply $x = y$,

then $H$ is called a hyper BCK-algebra, where $x \approx y$ is defined by $0 \in x \circ y$ and for any nonempty subsets $A, B$ of $H$, $A \approx B$ is defined by for all $a \in A$; there exists $b \in B$ such that $a \not\approx b$.

Example 2 (see [10]). We define an operation $\circ$ on $H = [0, \infty)$ by

\[
x \circ y = \begin{cases} 
0, & \text{if } x \leq y \\
0, & \text{if } x > y \neq 0 \\
x, & \text{if } y = 0;
\end{cases}
\]

then $(H, \circ, 0)$ is a hyper BCK-algebra.

Proposition 3 (see [10]). In a hyper BCK-algebra $H$, the condition (HK3) is equivalent to the following condition: for all $x, y \in H, x \circ y \approx \{ x \}$.

Proposition 4 (see [10]). In a hyper BCK-algebra $H$, the following hold.

1. For all $x \in H, x \circ 0 \approx \{ x \}, 0 \circ x \approx \{ 0 \}$, and $0 \circ 0 \approx \{ 0 \}$.
2. For any nonempty subsets $A, B$ and $C \subseteq H$, $(A \circ B) \circ C = (A \circ C) \circ B, A \circ B \approx A, 0 \circ A \approx \{ 0 \}$.

Proposition 5 (see [7, 10]). In any hyper BCK-algebra $H$, the following properties hold: for all $x, y, z \in H$, and for any nonempty subsets $A, B \subseteq H$,

1. $0 \circ 0 = \{ 0 \}$,
2. $0 \approx x$,
3. $x \approx x$,
4. $A \approx A$,
5. $A \subseteq B \Rightarrow A \approx B$,
6. $0 \circ x = \{ 0 \}$,
7. $0 \circ A = \{ 0 \}$,
8. $A \approx \{ 0 \} \Rightarrow A = \{ 0 \}$,
9. $A \circ B \approx A$,
10. $x \in x \circ 0$,
11. $x \circ 0 \approx \{ y \} \Rightarrow x \approx y$,
12. $y \approx z \Rightarrow x \circ z \approx x \circ y$,
13. $x \circ y = \{ 0 \} \Rightarrow (x \circ z) \circ (y \circ z) = \{ 0 \}, x \circ z \approx y \circ z$,
14. $A \circ \{ 0 \} = \{ 0 \} \Rightarrow A = \{ 0 \}$,
15. $x \circ 0 = \{ x \}$,
16. $x \in x \circ (x \circ y)$
17. $0 \circ (x \circ 0) = \{ 0 \}$ and $x \circ (0 \circ x) = \{ x \}$.

Definition 6 (see [10]). Let $I$ be a nonempty subset of a hyper BCK-algebra $H$. Then $I$ is said to be a hyper BCK-ideal of $H$ if

1. $0 \in I$,
2. $x \circ y \in I$ and $y \in I$ imply $x \in I$ for all $x, y \in H$.

Note that if $I$ is a hyper BCK-ideal of hyper BCK-algebra $H$, then $x \in I$ implies $x \circ y \subseteq I$.

Definition 7 (see [19]). A hyper BCK-algebra is called bounded if there is an element $e \in H$ such that $x \approx e$ for all $x \in H$. This element $e$ is called the unit of $H$, and we denote a bounded hyper BCK-algebra $(H; \circ, 0, e)$ simply by $H$.

Example 8. Let $H = \{ 0, 1, 2 \}$. Define a hyperoperation $\circ$ on $H$ as follows:

\[
\begin{array}{ccc}
\circ & 0 & 1 & 2 \\
0 & \{ 0 \} & \{ 0 \} & \{ 0 \} \\
1 & \{ 1 \} & \{ 0, 1 \} & \{ 0, 1 \} \\
2 & \{ 2 \} & \{ 0, 1, 2 \} & \{ 0, 1, 2 \} \\
\end{array}
\]

then $H$ is a bounded hyper BCK-algebra, where $0 \approx 1 \approx 2$.

In a hyper BCK-algebra $(H, \circ, 0)$, we define a hyperoperation $\wedge$ by $x \wedge y = y \circ (y \circ x)$ for all $x, y \in H$. For all $A, B \subseteq H$, $A \wedge B = \bigcup_{a \in A \wedge B} a \wedge b$. In general, $x \wedge y \neq y \wedge x$.

Proposition 9. Let $H$ be a hyper BCK-algebra. Then for any $x, y, z \in H$,

1. $x \wedge y \approx \{ y \}$,
2. $y \approx x \Rightarrow x \wedge y = \{ y \}$,
3. $y \approx z \Rightarrow y \wedge x \approx z \wedge x$.

Proof.

1. By (HK3) of Definition 1, we have $x \wedge y = y \circ (y \circ x) \subseteq y \circ H \approx \{ y \}$. Therefore $x \wedge y \approx \{ y \}$.
2. Suppose that $y \approx x$; then $0 \in y \circ x, y \circ 0 \subseteq y \circ (y \circ x)$. So $y \in y \circ 0$ by Proposition 5 (10). Hence $y \in y \circ (y \circ x)$ which implies $\{ y \} \subseteq x \wedge y$; that is, $y \approx x \wedge y$. Also $x \wedge y = \{ y \}$ by (1).
Let \((H, \circ, 0, e)\) be a bounded hyper BCK-algebra. Then we define \(x^\perp := e \circ x \) for any \(x \in H\).

**Proposition 10.** Let \((H, \circ, 0, e)\) be a bounded hyper BCK-algebra; the following hold:

1. \(x \ll y \Rightarrow y^\perp \ll x^\perp\),
2. \(x^\perp \circ y = y^\perp \circ x\),
3. \((x^\perp \circ y) \circ z = (x^\perp \circ z) \circ y = (z^\perp \circ x) \circ y = (z^\perp \circ y) \circ x = (y^\perp \circ z) \circ x = (y^\perp \circ x) \circ z\).

**Proof.** (1) Assume that \(x \ll y\); it is clear \(y^\perp \ll x^\perp\) by Proposition 5.

(2) By (HK2), \(x^\perp \circ y = (e \circ x) \circ y = (e \circ y) \circ x = y^\perp \circ x\).

(3) By (2) and (HK2), it is easy to prove (3). □

An MV-algebra is an algebra \((A, \oplus, 0, e)\) of type \((2, 1, 0)\) such that \((1) \oplus\) is commutative and associative, \((2) x \oplus 0 = x\), \((3) x \oplus 0 = 0\), \((4) x^\perp = x\), and \((5) y \oplus (y \oplus x^\perp) = x \oplus (x \oplus y^\perp)\). In [20], we know that MV-algebras are categorically equivalent to bounded commutative BCK-algebras. Now we discuss the relation between a bounded hyper BCK-algebra and an MV-algebra.

Define \(S(H) = \{x \in H : x \circ x = \{0\}\}\). Then we get the following results.

**Lemma 11** (see [6]). Every hyper BCK-algebra \(H\) is a BCK-algebra if and only if \(H = S(H)\).

**Theorem 12.** Let \((H, \circ)\) be a hyper BCK-algebra. If \(H\) satisfies the condition \(x \circ (x \circ y) = y \circ (y \circ x)\), for all \(x, y \in H\), then

1. \(x \circ (x \circ 0) = \{0\}\), for all \(x \in H\),
2. \(x \circ 0 = \{x\}\), for all \(x \in H\),
3. \(x \circ x = \{0\}\), for all \(x \in H\),
4. \(H = S(H)\).

**Proof.** (1) Suppose that \(x \circ (x \circ y) = y \circ (y \circ x)\), for all \(x, y \in H\). Let \(x \in H\); then we have \(x \circ (x \circ 0) = 0 \circ (0 \circ x) = \{0\}\) by Proposition 5, and so \(x \circ (x \circ 0) = \{0\}\).

(2) Let \(a \in x \circ 0\) for every \(x \in H\). Since \(x \circ 0 \ll \{x\}\), we get \(a \ll x\). On the other hand, \(x \circ a \ll x \circ (x \circ 0) = \{0\}\) and thus \(x \circ a = \{0\}\). Hence \(x \ll a\), and we conclude that \(x = a\). Consequently \(x \circ 0 = \{x\}\).

(3) For all \(x \in H\), we get \(x \circ x = \{0\}\) by (1) and (2).

(4) By (3) and Lemma 11 we have \(H = S(H)\). □

From Theorem 12, we obtain the relation between hyper BCK-algebras and MV-algebras.

**Corollary 13.** Let \((H, \circ, 0, e)\) be a bounded hyper BCK-algebra with the condition \(x \circ (x \circ y) = y \circ (y \circ x)\), for all \(x, y \in H\). Then \((H, \circ, 0, e)\) is a bounded commutative BCK-algebra. We define \(x^\perp := e \circ x\) for all \(x \in H\) and \(x \circ y = (x^\perp \circ y^\perp)\) for all \(x, y \in H\). Then \((H, \circ, 0, e)\) is an MV-algebra.

Now, let us review the structure of quotient hyper BCK-algebras on which we consider inf-Bosbach states in Section 4.

**Definition 14** (see [19]). Let \(\theta\) be an equivalence relation on a hyper BCK-algebra \(H\) and \(A, B \subseteq H\). Then,

1. \(A \theta B\) means that there exist \(a \in A\) and \(b \in B\) such that \(a \theta b\);
2. \(\overline{A \theta B}\) means that for all \(a \in A\) there exists \(b \in B\) such that \(a \theta b\) and for all \(b \in B\) there exists \(a \in A\) such that \(a \theta b\);
3. \(\theta\) is called a congruence relation on \(H\); if \(x \theta y\) and \(x' \theta y'\) then \(x \circ y = y' \circ x'\), for all \(x, x', y, y' \in H\);
4. \(\overline{\theta}\) is called a regular relation on \(H\); if \(x \circ x \theta \{0\}\) and \(y \circ y \theta \{0\}\), then \(x \theta y\) for all \(x, y \in H\).

**Lemma 15** (see [19]). Let \(\theta\) be an equivalence relation on \(H\) and \(A, B, C \subseteq H\). If \(A \theta B\) and \(B \theta C\), then \(A \theta C\).

**Lemma 16** (see [19]). Let \(\theta\) be an equivalence relation on \(H\). Then the following statements are equivalent:

1. \(\theta\) is a congruence relation on \(H\);
2. \(\overline{\theta}\) if \(x \theta y\) and \(x \theta a \theta y\), then \(x \circ y \theta x \circ a \theta y\), for all \(x, a, y \in H\).

**Theorem 17** (see [19]). Let \(\theta\) and \(\theta'\) be two regular congruence relations on \(H\) such that \([0]_{\theta'} = [0]_{\theta}\). Then \(\theta = \theta'\).

**Lemma 18** (see [19]). Let \(\theta\) be a congruence relation on \(H\). Then \([0]_{\theta}\) is a strong hyper BCK-ideal of \(H\).

**Theorem 19** (see [19]). Let \(\theta\) be a regular congruence relation on \(H\), \(I = [0]_{\theta}\) and \(H/I = [I_x : x \in H]\), where \([I_x]_{\theta} = [x]_{\theta}\) for all \(x \in H\). Then \((H/I, \circ, 0, e)\) is a hyper BCK-algebra, which is called a quotient hyper BCK-algebra, where \(\circ\) and \(\circ\) are defined as follows: \(I_x \circ I_y = [I_z : z \in x \circ y]\) and \(I_x \circ I_y = I_{x \circ y}\).

3. States on Bounded Hyper BCK-Algebras

In this section, the concepts of Bosbach states and inf-Bosbach states on a bounded hyper BCK-algebra are defined, and its properties are studied.

In what follows in this paper, we denote a bounded hyper BCK-algebra by \((H, \circ, 0, e)\) or \(H\), unless otherwise specified.

**Definition 20.** A function \(s : P^*(H) \rightarrow [0, 1]\) is called a Bosbach state on \(H\) if it satisfies the following conditions:

1. \(s(0) = 0, s(e) = 1\),
2. \(s(x) + s(y \circ x) = s(y) + s(x \circ y)\), for any \(x, y \in H\).

**Example 21.** Let \(H\) be defined in Example 8. We define \(s(0) = 0, s(1) = 1/2, s(2) = 1, s([0, 1]) = 0, s([0, 2]) = 0, s([1, 2]) = 1/2,\) and \(s([0, 1, 2]) = 0\). Then \(s\) is a Bosbach state on \(H\).

**Definition 22.** A function \(s : H \rightarrow [0, 1]\) is called an inf-Bosbach state on \(H\) if it satisfies the following conditions:

1. \(s(0) = 0, s(e) = 1\),
(2) \( s(x) + s(y \circ x) = s(y) + s(x \circ y) \), for any \( x, y \in H \),
where \( s(x) \) is an abbreviation of \( s(\{x\}) \), and \( s(A) \) is defined by \( s(A) = \inf\{s(t) \mid t \in A\} \) for any \( A \subseteq H \).

**Example 23.** Let \( H \) be defined in Example 8. Assume that \( s \) is an inf-Bosbach state on \( H \). Then we have \( s(0) = 0 \) and \( s(2) = 1 \). Assume \( s(1) = a \). Since \( s(1) + s(2 \circ 1) = s(2) + s(1 \circ 2) \), we have \( a + s(1) = 1 + s(0) \) and hence \( a + a = 1 + 0 \). Therefore \( a = 1/2 \). It follows that \( s \) is the unique inf-Bosbach state on \( H \).

The following example shows that not every bounded hyper BCK-algebra has an inf-Bosbach state.

**Example 24.** Let \( H = \{0, 1, 2, 3\} \). Define a hyperoperation “\( \circ \)" on \( H \) as follows:

<table>
<thead>
<tr>
<th>( o )</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Then \( H \) is a bounded hyper BCK-algebra, where \( 0 \leftrightarrow 1 \leftrightarrow 3 \leftrightarrow 2 \). Let \( s(0) = 0 \), \( s(1) = a \), \( s(3) = b \), and \( s(2) = 1 \). From \( s(x) + s(y \circ x) = s(y) + s(x \circ y) \), taking \( x = 1 \), \( y = 2 \), we get \( a = 1/2 \). Taking \( x = 1 \), \( y = 3 \), we get \( b = 1 \). Taking \( x = 2 \), \( y = 3 \), we get \( 1 = b + a = 1 + 1/2 \). It is a contradiction. Hence, \( H \) does not admit any inf-Bosbach state.

**Lemma 25.** Let \( s \) be an inf-Bosbach state on \( H \). Then \( s \) is a Bosbach state on \( H \).

Then we give some basic properties of inf-Bosbach states on hyper BCK-algebras.

**Proposition 26.** Let \( s \) be an inf-Bosbach state on \( H \). Then the following hold:

(1) \( x \leq y \Rightarrow s(y \circ x) = s(y) - s(x) \),
(2) \( x \leq y \Rightarrow s(x) \leq s(y) \),
(3) \( s(y \circ (y \circ x)) = s(y \circ x) \).

**Proof.** (1) and (2) are trivial. By Proposition 3 and (1), we get that \( s(y \circ (y \circ x)) = s(y) - s(y \circ (y \circ x)) = s(y) - s(y) = s(y \circ x) \). So (3) holds.

**Proposition 27.** Let \( s \) be an inf-Bosbach state on \( H \). Then,

(1) \( s(x \land y) = s(y) - s(y \circ x) \),
(2) \( x \land y = s(x \land y) \),
(3) \( s(x^-) = 1 - s(x), s(x^-) = s(x) \),
(4) \( s(x^- \circ y) = s(y \circ x), s(x \circ y^-) = s(y \circ x^-) \),
(5) \( y \leq x \Rightarrow s(x \circ y) = s(y \circ x^-) \).

**Proof.** (1) Note that \( y \circ x \leq \{y\} \) by Proposition 3, so we have \( s(x \land y) = s(y \circ (y \circ x)) = s(y) - s(y \circ x) \).

(2) Combining (1) and Definition 22, we get \( s(x \land y) - s(y \land x) = (s(y) - s(y \circ x)) - (s(x) - s(x \circ y)) = s(y) + s(x \circ y) - (s(x) + s(y \circ x)) = 0 \). Thus \( s(x \land y) = s(y \land x) \).

(3) Since \( x \leq e \), then \( s(x^-) = s(e \circ x) = s(e) - s(x) = 1 - s(x) \). Moreover, \( s(x^-) = 1 - s(x^-) = 1 - (1 - s(x)) = s(x) \).

(4) By Proposition 10, we get \( x \circ y = y \circ x \). So \( s(x \circ y) = s(y \circ x) \).

(5) Suppose \( y \leq x \); then we have \( x^- \leq y^- \). So \( s(x \circ y) = s(x) - s(y) = (1 - s(y)) - (1 - s(x)) = s(y^-) - s(x^-) = s(y \circ x^-) \).

The following theorem gives an equivalent characterization of inf-Bosbach states.

**Theorem 28.** Let \( s : H \rightarrow [0, 1] \) satisfy \( s(e) = 1 \). Then the following are equivalent:

(1) \( s \) is an inf-Bosbach state on \( H \);
(2) \( s(x \land y) = s(y \land x) \) and \( x \leq y \Rightarrow s(y \circ x) = s(y) - s(x) \).

**Proof.** (1) \( \Rightarrow \) (2) It follows from Proposition 27 (2) and Proposition 26 (1).

(2) \( \Rightarrow \) (1) \( s(0 \circ 0) = s(0) - s(0) = 0 \). Since \( s(x \land y) = s(y \land x) \), we obtain \( s(x) - s(y \circ x) = s(x) - s(x \circ y) \); that is, \( s(x) + s(y \circ x) = s(y) + s(y \circ x) \).

**Theorem 29.** Let \( s \) be an inf-Bosbach state on \( H \). Define \( K = \text{Ker}(s) = \{a \in H \mid s(a) = 0\} \) which is called the kernel of the inf-Bosbach state \( s \). Then \( K \) is a hyper BCK-ideal of \( H \).

**Proof.** Clearly, \( 0 \in K \). Let \( x \circ y \leq K \) and \( y \in K \). So \( s(y) = 0 \). Since \( x \circ y \leq K \), then for all \( t \in x \circ y \), there is \( i \in K \) such that \( t \leq i \). Since \( s \) is order-preserving, we have \( s(t) \leq s(i) = 0 \). Hence \( s(t) = 0 \); that is, \( x \circ y = 0 \). Also note that \( y \circ x \leq \{y\} \), so \( s(y \circ x) \leq s(y) = 0 \). This shows that \( s(y \circ x) = 0 \). We obtain \( s(x) = 0 \) by the definition of inf-Bosbach state \( s \). Therefore, we have \( x \in K \).

4. **States on Quotient Hyper BCK-Algebras**

In this section, we study the inf-Bosbach states on quotient hyper BCK-algebras.

**Definition 30.** Let \( s \) be an inf-Bosbach state and let \( \theta \) be a congruence relation on \((H, \circ, e, 0, 1)\). Then \( s \) is called \( \theta \)-compatible if \( s(x) \) is defined by \( s(x) = s(y) \) if and only if \( x \theta y \) for all \( x, y \in H \).

**Lemma 31.** Let \( \theta \) be a regular congruence relation and let \( s \) be a \( \theta \)-compatible inf-Bosbach state on \( H \). Define \( I = \{0\}_\theta \), \( I = \{0\}_\theta \), \( I = \{0\}_\theta \), \( I = \{0\}_\theta \), where \( I = \{0\}_\theta \), \( I = \{0\}_\theta \), \( I = \{0\}_\theta \), \( I = \{0\}_\theta \), the following hold:

(1) \( I < I_y \) if and only if \( s(x \circ y) = 0 \),
(2) \( I_x = I_y \) if and only if \( s(x) = s(y) \).

**Proof.** (1) Since \( I < I_y \) implies \( I \subseteq I_x \subseteq I_y \), then there exists \( z \in x \circ y \) such that \( z \theta 0 \). By Definition 30, we get that \( s(z) = 0 \). Then \( s(x \circ y) = \text{inf}(s(t) \mid t \in x \circ y) = 0 \). On the other hand, suppose that \( s(x \circ y) = 0 \). Then there is \( z \in x \circ y \) such that \( z \theta 0 \). Moreover we get \( I_z = I_y = I \); that is, there is \( I_z \subseteq I_x \subseteq I_y \) such that \( I_z = I_y \). This means that \( I_x < I_y \).
(2) It is clear that $I_x = I_y$ if and only if $x \theta y$ if and only if $s(x) = s(y)$.

**Theorem 32.** Let $\theta$ be a regular congruence relation and let $s$ be a $\theta$-compatible inf-Bosbach state on $H$. Take $I = [0]_\theta$. Define a map $\hat{s} : H/I \rightarrow [0,1]$ by $\hat{s}(I_x) = s(x)$ and $\hat{s}(I_x : x \in A) = \inf\{\hat{s}(I_t) : t \in A\}$, for any $x \in H$ and $A \subseteq H$. Then $\hat{s}$ is an inf-Bosbach state on $H/I$.

Proof. By Lemma 31, the definition of $\hat{s}$ is well defined. Clearly, $\hat{s}(I) = s(0) = 0$ and $\hat{s}(I) = s(e) = 1$. Since $\hat{s}(I_x \circ I_y) = \inf\{\hat{s}(I_t) : t \in x \circ y\} = \inf\{\hat{s}(t) : t \in x \circ y\} = s(x \circ y)$, then $\hat{s}(I_x) + \hat{s}(I_y) = s(x) + s(y \circ x) = s(x) + s(y \circ y) = \hat{s}(I_y) + \hat{s}(I_x + I_y)$. Therefore, $\hat{s}$ is an inf-Bosbach state on $H/I$.

**Definition 33.** Let $\theta$ be a regular congruence relation on $H$. Then $\theta$ is called $\circ$-compatible if there is $I \in H$ such that $x \circ I \subseteq [I]_\theta$ for all $x, y \in H$.

**Lemma 34.** Let $\theta$ be a $\circ$-compatible regular congruence relation on $H$. Then there is $u \in H$ such that $x \circ y \subseteq [u]_\theta$ for all $x, y \in H$.

Proof. Since $\theta$ is $\circ$-compatible, there exists $t \in H$ such that $y \circ x \subseteq [t]_\theta$ for all $t, y \in H$. Hence $x \circ y = y \circ (y \circ x) \subseteq y \circ [t]_\theta$. For any $a, b \in [t]_\theta$, we have $a \theta b$. Since $\theta$ is a congruence relation, then $y \circ a \theta y \circ b$. Since $\theta$ is a $\circ$-compatible, there exists $u \in H$ such that $y \circ a \subseteq [u]_\theta$ and $y \circ b \subseteq [u]_\theta$. This shows that for any $w \in [t]_\theta$, $y \circ w$ is contained in the same equivalence class. Hence $y \circ [t]_\theta \subseteq [u]_\theta$. It follows that $x \circ y \subseteq [u]_\theta$.

**Lemma 35.** Let $\theta$ be a $\circ$-compatible regular congruence relation on $H$. Then $(x \circ y) \theta (y \circ x)$ for all $x, y \in H$.

Proof. By Lemma 34, there exists $u \in H$ such that $x \circ y \subseteq [u]_\theta$ for all $x, y \in H$. Similarly, there exists $v \in H$ such that $x \circ y \subseteq [v]_\theta$. By Proposition 27, $s(x \circ y) = s(y \circ x)$ and $s(a) = s(b)$ for some $a \in x \circ y$ and $b \in y \circ x$. Since $s$ is $\theta$-compatible, then $a \theta b$. Hence $[u]_\theta = [a]_\theta = [b]_\theta = [v]_\theta$. Therefore, $x \circ y \subseteq [u]_\theta$ and $y \circ x \subseteq [u]_\theta$, which implies $(x \circ y) \theta (y \circ x)$.

**Lemma 36.** Let $\theta$ be a regular congruence relation on $H$ and $I = [0]_\theta$. Then for any $x, y \in H$, $I_x \cap I_y = I_{x \circ y}$ in $(H/I, \circ, I, I_x)$.

Proof. Note that $I_x \cap I_y = I_x \cap (I_y : t \in x \circ y) = (I_y : t \in x \circ y) = [I_x : u \in y \circ t, t \in x \circ y] = [I_x : u \in y \circ (y \circ x)] = [I_x : u \in x \circ y] = I_{x \circ y}$.

**Lemma 37.** Let $\theta$ be a $\circ$-compatible regular congruence relation on $H$ and let $s$ be a $\theta$-compatible inf-Bosbach state on $(H, \circ, 0, e)$. Then the bounded quotient hyper BCK-algebra $H/I$ is a bounded commutative BCK-algebra.

Proof. Note that $I_x \circ I_y = [I_x, z \in x \circ y]$. Since $\theta$ is $\circ$-compatible, then there is $t \in H$ such that $x \circ y \subseteq [t]_\theta$. This shows that $[I_x \circ I_y] = 1$ for all $x, y \in H$. It follows that $H/I$ is a BCK-algebra. Since $\theta$ is $\circ$-compatible, then by Lemma 34, there is $u \in H$ such that $x \circ y \subseteq [u]_\theta$. Hence $I_x \cap I_y \subseteq [I_{x \circ y}]_\theta$. Therefore, $I_x \cap I_y = I_{x \circ y}$. Note that $H/I$ is a BCK-algebra and by Lemma 36, we get $I_x \cap I_y = I_{x \circ y}$. By Lemma 35, $I_x \cap I_y = I_{x \circ y}$. Therefore, $I_x \cap I_y = I_{x \circ y}$.

Summarizing the above conclusions, we get the following result.

**Theorem 38.** Let $\theta$ be a $\circ$-compatible regular congruence relation and $s$ be a $\theta$-compatible inf-Bosbach state on $H$. Take $I = [0]_\theta$. Define $I_x \circ I_y = ((I_x \circ I_y) \circ I_y)$ for all $I_x, I_y \in H/I$. Then $(H/I, \circ, s)$ is an MV-algebra. Moreover, the map $\hat{s} : H/I \rightarrow [0,1]$ defined as Theorem 32 is an inf-Bosbach state on $H/I$ and the following hold:

1. $\hat{s}(I_x \circ I_y) = s(x \circ y)$,
2. $\hat{s}(I_x) = 1 - s(x)$,
3. $\hat{s}(I_x \circ I_y) = 1 - s(x \circ y)$,
4. $\hat{s}(I_x \cap I_y) = \hat{s}(I_x \cap I_y) = s(x \cap y) = s(y \cap x)$.

**5. Hyper Measures on Hyper BCK-Algebras**

In this section, we study the hyper measures on hyper BCK-algebras.

Define "*$" on the real interval $X = [0, \infty)$ as follows: $x * y = \max\{0, x - y\}$, for all $x, y \in X$. Then $(X, *, 0)$ is a BCK-algebra.

**Definition 39.** Let $(H, *, 0)$ be a hyper BCK-algebra. A map $m : P^*(H) \rightarrow [0,1]$, such that, for all $x, y \in H$,

1. $m(x * y) = m(x) - m(y)$ whenever $y \ll x$ is said to be a hyper measure;
2. If $H$ is bounded, $e$ is the unit of $H$, and $m$ is a hyper measure with $m(e) = 1$, then $m$ is said to be a hyper state;
3. $m(x * y) = m(x) * m(y)$ is said to be a hyper measure-morphism;
4. If $H$ is bounded, $e$ is the unit of $H$, and $m$ is a hyper measure-morphism with $m(e) = 1$, then $m$ is said to be a hyper state-morphism.

Obviously any hyper measure-morphism on a hyper BCK-algebra $H$ is a hyper measure.

**Proposition 40.** Let $m$ be a hyper measure on hyper BCK-algebra $(H, *, 0)$. Then for all $x, y \in H$, one has the following:

1. $m(0) = 0$,
2. $x \ll y$ implies $m(x) \leq m(y)$,
3. $x \ll y$ implies $m(x \cap y) = m(x)$,
4. $m(x \circ (y \cap x)) = m(x \circ y)$.

Proof. (1) Clearly we have $m(0) = m(0*0) = m(0) - m(0) = 0$.
(2) Since $x \ll y$ implies $m(x * y) = m(y) - m(x) \geq 0$, then $m(x) \leq m(y)$.
(3) Note that $x \ll y$ implies $m(x \cap y) = m(x \circ (y \circ x)) = m(y) - m(y \circ x) = m(y) - (m(y) - m(x)) = m(x)$. 

Then \((H/ \ker(m), \circ, \overline{0}, \overline{e})\) is a bounded commutative BCK-algebra, where \(\overline{x} = x/\ker(m)\) and \(\overline{x} \circ \overline{y} = (x \circ y)/\ker(m)\) for all \(\overline{x}, \overline{y} \in H/\ker(m)\). And \(\overline{x} \leq \overline{y}\) is defined by \(\overline{x} \circ \overline{y} = \overline{0}\).

Moreover, define a map \(M : H/\ker(m) \to [0,1]\) by \(M(\overline{x}) = m(x)\), \(\overline{x} \in H/\ker(m)\). Then,

- (1) \(\overline{x} \leq \overline{y}\) if and only if \(m(x \circ y) = 0\) if and only if \(M(\overline{x}) \leq M(\overline{y})\);
- (2) \(\overline{x} = \overline{y}\) if and only if \(m(x \circ y) = m(y \circ x) = 0\) if and only if \(M(\overline{x}) = M(\overline{y})\);
- (3) \(M\) is a state-morphism on \(H/\ker(m)\).

Proof. By Proposition 42, \(m(x \circ y) = m(y \circ x)\). Then for all \(t \in x \circ y\) there exists \(s \in y \circ x\) such that \(m(t) = m(s)\) and for all \(t' \in y \circ x\) there exists \(s' \in x \circ y\) such that \(m(t') = m(s')\). Therefore, \((t \circ s) = m(s) = m(t' \circ s') = m(s' \circ t') = 0\), which implies \(t \circ s \leq t', t' \circ s' \leq t' \circ s' \leq t' \circ t'' \leq \ker(m)\). So \(t \circ s \leq t' \circ s' \leq t' \circ t'' \leq \ker(m)\). Therefore, \(t \circ s \leq t' \circ s' \leq t' \circ t'' \leq \ker(m)\). In \(H/\ker(m)\), \(\overline{x} \circ \overline{y} = (x \circ y)/\ker(m)\) if and only if \(M(\overline{x}) \leq M(\overline{y})\). So, we have \(M(\overline{x} \circ \overline{y}) = M(\overline{x}) \circ M(\overline{y})\). By Theorem 44, \(H/\ker(m)\) is a BCK-algebra.

Combining the above arguments, we get \(H/\ker(m)\) is a bounded commutative BCK-algebra.

In the following, we prove the second part of the theorem.

(1) Note that \(\overline{x} \leq \overline{y}\) if and only if \(x \circ y / \ker(m) = 0\) if and only if \((x \circ y)/\ker(m) = 0\), which implies \(x \circ y \leq y, y \circ x \leq x\). Therefore, \((x \circ y) \leq y\) if and only if \(m(x \circ y) = 0\) if and only if \(M(\overline{x}) \leq M(\overline{y})\).

(2) Similar to (1), we can prove (2).

(3) By (2), for all \(\overline{x}, \overline{y} \in H/\ker(m)\), \(\overline{x} \leq \overline{y}\) if and only if \(m(x \circ y) = 0\) if and only if \(M(\overline{x}) \leq M(\overline{y})\). Therefore, the definition of \(M\) is well defined. It is obvious that \(M(0) = 0\) and \(M(\overline{e}) = 1\). Note that \(M(\overline{x} \circ \overline{y}) = M((x \circ y)/\ker(m))\) if \(M(\overline{x}) = M(\overline{y})\). Therefore, \(M\) is a state-morphism on \(H/\ker(m)\).

Corollary 47. In \((H/\ker(m), \circ, \overline{0}, \overline{e})\) as Theorem 46, define \(\overline{x} = \overline{e} \circ \overline{x}\) and \(\overline{x} \circ \overline{y} = (x \circ y)/\ker(m)\) for all \(\overline{x}, \overline{y} \in H/\ker(m)\). Then \((H/\ker(m), \circ, \overline{e})\) is an MV-algebra. The map \(M : H/\ker(m) \to [0,1]\) defined as Theorem 46 is a state-morphism on MV-algebra \(H/\ker(m)\), and

- (1) \(M(\overline{0}) = m(x \circ y)\);
- (2) \(M(\overline{x}) = 1 - m(x)\);
- (3) \(M(\overline{x} \circ \overline{y}) = 1 - m(x \circ y)\);
- (4) \(M(\overline{x} \circ \overline{y}) = M(\overline{y} \circ \overline{x}) = m(x \circ y) = m(y \circ x)\).
6. Conclusions

In this paper, we mainly study the state theory on hyper structures and introduce a notion of states on hyper BCK-algebras. In order to adapt a state to hyper operation, we define the state on a subset by \( s(A) = \inf \{ s(t) : t \in A \} \). Using the definitions of \( \circ \)-compatibled regular congruence relations and \( \theta \)-compatibled inf-Bosbach states on hyper BCK-algebras, we prove that the quotient structure of a bounded hyper BCK-algebra is an MV-algebra. Moreover, we define hyper measures on hyper BCK-algebras; then we introduce hyper states, hyper measure-morphisms, and hyper state-morphisms. We prove that a hyper state-morphism on hyper BCK-algebra is a Bosbach state. In the further work, we will solve the problem of how to define a state on a bounded hyper BCK-algebra to make the quotient structure form a hyper MV-algebra.

Conflict of Interests
