The dissipative periodic 2-component Degasperis-Procesi system is investigated. A local well-posedness for the system in Besov space is established by using the Littlewood-Paley theory and a priori estimates for the solutions of transport equation. The wave-breaking criteria for strong solutions to the system with certain initial data are derived.

1. Introduction

We consider the following dissipative periodic 2-component Degasperis-Procesi system:

$$\begin{aligned} u_t - u_{xxt} + 4uu_x + \lambda_1(u - u_{xx}) + c\rho\rho_x &= 3u_xu_{xx} + uu_{xxx}, \\ t > 0, \quad x \in \mathbb{S}, \\ \rho_t + u\rho_x + 2u_x\rho + \lambda\rho &= 0, \quad t > 0, \quad x \in \mathbb{S}, \\ u(t, x) = u(t, x + 1), \quad \rho(t, x) &= \rho(t, x + 1), \\ t \geq 0, \quad x \in \mathbb{S}, \\ u(0, x) = u_0(x), \quad \rho(0, x) &= \rho_0(x), \quad x \in \mathbb{S}, \end{aligned} \quad (1)$$

where λ and λ_1 are nonnegative constants, $c \in \mathbb{R}$, $(u_0, \rho_0) \in B_{p,r}^s(\mathbb{S}) \times B_{p,r}^{s-1}(\mathbb{S})$ with $s > \max(3/2, 1 + 1/p)$, and $\mathbb{S} = \mathbb{R}/\mathbb{Z}$ denotes the unit circle.

In system (1), if $\lambda_1 = \rho = 0$, we get the classical Degasperis-Procesi equation [1]

$$u_t - u_{xxt} + 4uu_x = 3u_xu_{xx} + uu_{xxx}, \quad (2)$$

where $u(t, x)$ represents the fluid velocity at time t in x direction (or equivalently the height of water's free surface above a flat bottom). The nonlinear convection term uu_x

causes the steepening of the wave form. The nonlinear dispersion effect term $3u_xu_{xx} + uu_{xxx}$ makes the wave form spread.

Equation (2) has attracted many researchers to discover its dynamics properties [2–15]. For example, Degasperis et al. [2] proved the formal integrability by constructing a Lax pair. They showed that (2) has bi-Hamiltonian structure with an infinite sequence of conserved quantities and admits exact peakon solutions which are analogous to the Camassa-Holm peakons. The asymptotic accuracy of (2) is the same as that of Camassa-Holm equation. Dullin et al. [3] showed that the Degasperis-Procesi equation can be derived from the shallow water elevation equation by an appropriate Kodama transformation. Lin and Liu [16] proved the stability of peakons for (2) under certain assumptions. In [17], Yin proved the local well-posedness for (2) with initial data $u_0 \in H^s(\mathbb{R})$ ($s > 3/2$) and also derived the precise blow-up scenarios for the solutions. The global existence of strong solutions and global weak solutions to (2) are studied in [18]. Escher and Kolev [4] and Escher and Seiler [5] showed that the Degasperis-Procesi equation can be reformulated as a nonmetric Euler equation on the diffeomorphism group of the circle. Vakhnenko and Parkes [7] derived periodic and solitary wave solutions to (2). Lundmark and Szmigielski [8] investigated multipeakon solutions to (2). The shock wave solutions to (2) were obtained in [9]. Although the Degasperis-Procesi equation is similar to the Camassa-Holm

equation in many aspects, especially in the structure of equation, there are some differences between the two equations. One of the famous features of Degasperis-Procesi equation is that it not only has peakon solutions $u(t, x) = ce^{-|x-ct|}$ with $c > 0$ [2] and periodic peakon solutions [18] but also has shock peakons [9] and periodic shock waves [19].

In general, it is difficult to avoid the energy dissipation mechanisms in a real world. Thus different types of solutions for the dissipative Degasperis-Procesi equation have been investigated. For example, Guo et al. [20] studied the dissipative Degasperis-Procesi equation

$$u_t - u_{xxt} + 4uu_x + \lambda(u - u_{xx}) = 3u_x u_{xx} + uu_{xxx}, \quad (3)$$

where $\lambda(u - u_{xx})$ ($\lambda > 0$) is the dissipative term. They obtained the global existence of weak solutions. Wu and Yin [21] established blow-up solutions and analyzed the decay of solutions to (3). In [22], the authors studied the long time behavior of solutions to (3). Guo [23] established the local well-posedness, blow-up scenario, global existence of solutions, and persistence properties for strong solutions to (3).

On the other hand, many researchers have studied the integrable multicomponent generalizations of the Degasperis-Procesi equation [24–29]. For example, Yan and Yin [28] investigated the 2-component Degasperis-Procesi system

$$\begin{aligned} u_t - u_{xxt} + 4uu_x + c\rho\rho_x &= 3u_x u_{xx} + uu_{xxx}, \\ t > 0, \quad x &\in \mathbb{R}, \\ \rho_t + u\rho_x + 2u_x\rho &= 0, \quad t > 0, \quad x \in \mathbb{R}, \\ u(0, x) &= u_0(x), \quad x \in \mathbb{R}, \\ \rho(0, x) &= \rho_0(x), \quad x \in \mathbb{R}, \end{aligned} \quad (4)$$

where $c \in \mathbb{R}$. They established the local well-posedness for system (4) in Besov space $B_{p,r}^s(\mathbb{R}) \times B_{p,r}^{s-1}(\mathbb{R})$ with $s > \max(1 + 1/p, 3/2)$ and also derived the precise blow-up scenarios for strong solutions in Sobolev space $H^s(\mathbb{R}) \times H^{s-1}(\mathbb{R})$ with $s > 3/2$. Zhou et al. [27] investigated the traveling wave solutions of the 2-component Degasperis-Procesi system. Jin and Guo [25] established the local well-posedness, blow-up criterions and the persistence properties of strong solutions to the system in $H^s(\mathbb{R}) \times H^s(\mathbb{R})$ with $s > 5/2$.

Recently, a large amount of literature was devoted to the 2-component Camassa-Holm system [30–39]. For example, Hu [40] studied the dissipative periodic 2-component Camassa-Holm system

$$\begin{aligned} u_t - u_{xxt} + 3uu_x + \lambda(u - u_{xx}) + \rho\rho_x &= 2u_x u_{xx} + uu_{xxx}, \\ t > 0, \quad x &\in \mathbb{S}, \end{aligned}$$

$$\rho_t + u\rho_x + u_x\rho + \lambda\rho = 0, \quad t > 0, \quad x \in \mathbb{S},$$

$$u(t, x) = u(t, x + 1), \quad \rho(t, x) = \rho(t, x + 1),$$

$$t \geq 0, \quad x \in \mathbb{S},$$

$$u(0, x) = u_0(x), \quad \rho(0, x) = \rho_0(x), \quad x \in \mathbb{S},$$

(5)

where $\lambda > 0$. The author not only established the local well-posedness for system (5) in Besov space $B_{p,r}^s(\mathbb{S}) \times B_{p,r}^{s-1}(\mathbb{S})$ with $s > \max(1 + 1/p, 3/2)$ but also presented global existence of solutions and the exact blow-up scenarios of strong solutions in Sobolev space $H^s(\mathbb{S}) \times H^{s-1}(\mathbb{S})$ with $s > 3/2$. It was shown in [41] that the dissipative Camassa-Holm, Degasperis-Procesi, Hunter-Saxton, and Novikov equations can be reduced to their nondissipative versions by means of an exponentially time dependent scaling.

Motivated by the work in [20, 28, 32, 40–43], we study the dissipative periodic 2-component Degasperis-Procesi system (1). We note that the Cauchy problem of system (1) in Besov space has not been discussed yet. One of the difficulties is that we can not obtain the estimates for $\int_{\mathbb{R}} (u^2 + u_x^2 + \rho^2) dx$, which is a conserved quantity playing a key role in studying the blow-up phenomenon of the 2-component Camassa-Holm system [32, 33]. However, this difficulty has been dealt with by establishing the estimates for $\|u(t)\|_{L^\infty}$, where u is the first component of solution (u, ρ) to system (1). We state our main task with two aspects. Firstly, we establish the local well-posedness for system (1) in Besov space. Secondly, we present the precise blow-up criterions for strong solutions.

We rewrite system (1) as

$$\begin{aligned} u_t + uu_x &= P(D) \left(\frac{3}{2}u^2 + \frac{c}{2}\rho^2 \right) - \lambda_1 u, \\ t > 0, \quad x &\in \mathbb{S}, \end{aligned}$$

$$\rho_t + u\rho_x = -2u_x\rho - \lambda\rho, \quad t > 0, \quad x \in \mathbb{S}, \quad (6)$$

$$u(t, x) = u(t, x + 1), \quad \rho(t, x) = \rho(t, x + 1),$$

$$t \geq 0, \quad x \in \mathbb{S},$$

$$u(0, x) = u_0(x), \quad \rho(0, x) = \rho_0(x), \quad x \in \mathbb{S},$$

where the operator $P(D) = -\partial_x(1 - \partial_x^2)^{-1}$. We write the space

$$E_{p,r}^s(T)$$

$$= \begin{cases} C([0, T]; B_{p,r}^s(\mathbb{S})) \cap C^1([0, T]; B_{p,r}^{s-1}(\mathbb{S})), & 1 \leq r < \infty, \\ L^\infty([0, T]; B_{p,\infty}^s(\mathbb{S})) \cap \text{Lip}([0, T]; B_{p,\infty}^{s-1}(\mathbb{S})), & r = \infty, \end{cases}$$

(7)

with $T > 0$, $s \in \mathbb{R}$, $p \in [1, \infty]$, $r \in [1, \infty]$.

The main results of this paper are presented as follows.

Theorem 1. Let $1 \leq p, r \leq \infty$, $s > \max(3/2, 1 + 1/p)$, and $(u_0, \rho_0) \in B_{p,r}^s(\mathbb{S}) \times B_{p,r}^{s-1}(\mathbb{S})$. Then there exists a time $T > 0$ such that the Cauchy problem (1) has a unique solution $(u, \rho) \in E_{p,r}^s(T) \times E_{p,r}^{s-1}(T)$. The map $(u_0, \rho_0) \rightarrow (u, \rho)$ is continuous from a neighborhood of (u_0, ρ_0) in $B_{p,r}^s(\mathbb{S}) \times B_{p,r}^{s-1}(\mathbb{S})$ into $C([0, T]; B_{p,r}^{s'}(\mathbb{S})) \cap C^1([0, T]; B_{p,r}^{s'-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s'-1}(\mathbb{S})) \cap C^1([0, T]; B_{p,r}^{s'-2}(\mathbb{S}))$ for every $s' < s$ when $r = \infty$ and $s' = s$ whereas $r < \infty$.

Theorem 2. Let $(u_0, \rho_0) \in H^s(\mathbb{S}) \times H^{s-1}(\mathbb{S})$ with $s > 3/2$ and $T < \infty$ is the maximal existence time of corresponding solution (u, ρ) to system (1). Then

$$\int_0^T \|\partial_x u(\tau)\|_{L^\infty} d\tau = \infty. \quad (8)$$

Theorem 3. Let $(u_0, \rho_0) \in H^s(\mathbb{S}) \times H^{s-1}(\mathbb{S})$ with $s > 3/2$ and $T < \infty$ is the maximal existence time of corresponding solution (u, ρ) to system (1). Then the solution (u, ρ) blows up in finite time if and only if

$$\liminf_{t \rightarrow T^-} \inf_{x \in \mathbb{S}} u_x(t, x) = -\infty. \quad (9)$$

Theorem 4. Let $c \geq 0$ in system (1) and $(u_0, \rho_0) \in H^s(\mathbb{S}) \times H^{s-1}(\mathbb{S})$ with $s > 5/2$. Assume that u_0 is odd, ρ_0 is even, $u_{0x}(0) < -\lambda_1$, and $\rho_0(0) = 0$. Then the corresponding solution (u, ρ) to system (1) blows up in finite time. More precisely, there exists $T \in (0, -1/(1 - \delta)(u_{0x}(0) + \lambda_1/2)]$ such that

$$\liminf_{t \rightarrow T^-} u_x(t, 0) = -\infty. \quad (10)$$

In addition, if $\rho_{0x}(x_0) \neq 0$ with some $x_0 \in \mathbb{S}$ satisfying $u_{0x}(x_0) = \inf_{x \in \mathbb{S}} u_{0x}(x)$, then there exists $T_1 \in (0, -1/(1 - \delta)(u_{0x}(0) + \lambda_1/2)]$ such that

- (i) $\limsup_{t \rightarrow T_1^-} \sup_{x \in \mathbb{S}} \rho_x(t, x) = +\infty$ if $\rho_{0x}(x_0) > 0$;
- (ii) $\liminf_{t \rightarrow T_1^-} \inf_{x \in \mathbb{S}} \rho_x(t, x) = -\infty$ if $\rho_{0x}(x_0) < 0$,

where $\delta \in (0, 1)$ such that $-\sqrt{\delta}[u_{0x}(0) + \lambda_1/2] = \lambda_1/2$.

Theorem 5. Let $c \geq 0$ in system (1) and $(u_0, \rho_0) \in H^s(\mathbb{S}) \times H^{s-1}(\mathbb{S})$ with $s > 5/2$. Assume that u_0 and ρ_0 are odd, $u_{0x}(0) < -\lambda_1$. Then the corresponding solution (u, ρ) to system (1) blows up in finite time. More precisely, there exists $T_2 \in (0, -1/(1 - \delta)(u_{0x}(0) + \lambda_1/2)]$ such that

$$\liminf_{t \rightarrow T_2^-} u_x(t, 0) = -\infty. \quad (11)$$

In addition, the inequalities hold:

- (i) $\rho_x(t, 0) > \rho_{0x}(0)e^{-(3u_{0x}(0) + \lambda_1)t}$ if $\rho_{0x}(0) > 0$;
- (ii) $\rho_x(t, 0) < \rho_{0x}(0)e^{-(3u_{0x}(0) + \lambda_1)t}$ if $\rho_{0x}(0) < 0$.

The remainder of this paper is organized as follows. In Section 2, several properties of Besov space and a priori estimates for solutions of transport equation are reviewed.

Section 3 is devoted to the proof of Theorem 1. The proofs of Theorems 2, 3, 4, and 5 are presented in Section 4.

Notation. We denote the norm in Lebesgue space L^p , $1 \leq p \leq \infty$, by $\|\cdot\|_{L^p}$, the norm in Sobolev space H^s , $s \in \mathbb{R}$, by $\|\cdot\|_{H^s}$, and the norm in Besov space $B_{p,r}^s$, $s \in \mathbb{R}$, by $\|\cdot\|_{B_{p,r}^s}$. Since functions in all the spaces are over $\mathbb{S}$, for simplicity, we drop $\mathbb{S}$ in our notations if there is no ambiguity. We denote $a+ = a + \varepsilon$, where $\varepsilon > 0$ is a sufficiently small number.

2. Preliminary

This section is concerned with some basic facts in periodic Besov space and the theory of transport equation. One may check [33, 44–49] for more details.

Proposition 6 (see [44, 46]). There exists a couple of smooth functions (χ, φ) valued in $[0, 1]$, such that χ is supported in the ball $B = \{\xi \in \mathbb{R} \mid |\xi| \leq 4/3\}$, and φ is supported in the ring $C = \{\xi \in \mathbb{R} \mid 3/4 \leq |\xi| \leq 8/3\}$. Moreover,

$$\chi(\xi) + \sum_{q \in \mathbb{N}} \varphi(2^{-q}\xi) = 1, \quad \forall \xi \in \mathbb{R},$$

$$\text{supp } \varphi(2^{-q}\cdot) \cap \text{supp } \varphi(2^{-q'}\cdot) = \emptyset, \quad \text{if } |q - q'| \geq 2, \quad (12)$$

$$\text{supp } \chi(\cdot) \cap \text{supp } \varphi(2^{-q}\cdot) = \emptyset, \quad \text{if } q \geq 1.$$

Then, for all $u \in S'(\mathbb{S})$, we define the nonhomogeneous dyadic blocks as follows:

$$\begin{aligned} \Delta_q u &= 0, \quad \text{if } q \leq -2; \\ \Delta_{-1} u &= \sum_{\xi \in \mathbb{Z}} \chi(\xi) \hat{u}(\xi) e^{2\pi i x \xi}; \end{aligned} \quad (13)$$

$$\Delta_q u = \sum_{\xi \in \mathbb{Z}} \varphi(2^{-q}\xi) \hat{u}(\xi) e^{2\pi i x \xi}, \quad \text{if } q \geq 0.$$

Thus $u = \sum_{q \geq -1} \Delta_q u$, which is called the nonhomogeneous Littlewood-Paley decomposition of u .

Proposition 7 (see [44, 46]). Let $s \in \mathbb{R}$, $1 \leq p, r \leq \infty$. The nonhomogeneous periodic Besov space $B_{p,r}^s(\mathbb{S})$ is defined by $B_{p,r}^s(\mathbb{S}) = \{f \in S'(\mathbb{S}) \mid \|f\|_{B_{p,r}^s(\mathbb{S})} < +\infty\}$, where

$$\|f\|_{B_{p,r}^s(\mathbb{S})} = \begin{cases} \left(\sum_{j=-1}^{\infty} 2^{jrs} \|\Delta_j f\|_{L^p}^r \right)^{1/r}, & r < \infty, \\ \sup_{j \geq -1} 2^{js} \|\Delta_j f\|_{L^p}, & r = \infty. \end{cases} \quad (14)$$

Moreover, the low frequency cut-off S_q is defined as $S_q u = \sum_{p=-1}^{q-1} \Delta_p u$ for all $q \in \mathbb{N}$.

Proposition 8 (see [44, 49]). Let $s \in \mathbb{R}$, $1 \leq p, r, p_1, p_2, r_1, r_2 \leq \infty$; then consider the following.

- (1) Density: C_c^∞ is dense in $B_{p,r}^s \Leftrightarrow 1 \leq p, r < \infty$.

(2) *Embedding:* $B_{p_1, r_1}^s \hookrightarrow B_{p_2, r_2}^{s-n(1/p_1-1/p_2)}$, if $p_1 \leq p_2$, $r_1 \leq r_2$. $B_{p, r_2}^{s_2} \hookrightarrow B_{p, r_1}^{s_1}$ is locally compact if $s_1 \leq s_2$.

(3) *Algebraic properties:* for all $s > 0$, $B_{p, r}^s \cap L^\infty$ is an algebra. $B_{p, r}^s$ is an algebra $\Leftrightarrow B_{p, r}^s \hookrightarrow L^\infty \Leftrightarrow s > n/p$ or $s \geq n/p$ and $r = 1$.

(4) *Complex interpolation:* consider

$$\|f\|_{B_{p, r}^{\theta s_1 + (1-\theta)s_2}} \leq C \|f\|_{B_{p, r}^{s_1}}^\theta \|f\|_{B_{p, r}^{s_2}}^{1-\theta}, \quad (15)$$

$$\forall f \in B_{p, r}^{s_1} \cap B_{p, r}^{s_2}, \quad \theta \in [0, 1].$$

(5) *Fatou's Lemma:* if $(u_n)_{n \in \mathbb{N}}$ is bounded in $B_{p, r}^s$ and $u_n \rightarrow u$ in $S'(\mathbb{S})$, then $u \in B_{p, r}^s$ and

$$\|u\|_{B_{p, r}^s} \leq \liminf_{n \rightarrow \infty} \|u_n\|_{B_{p, r}^s}. \quad (16)$$

(6) *1-D Morse-type estimates.*

(i) For $s > 0$,

$$\|fg\|_{B_{p, r}^s} \leq C \left(\|f\|_{B_{p, r}^s} \|g\|_{L^\infty} + \|f\|_{L^\infty} \|g\|_{B_{p, r}^s} \right). \quad (17)$$

(ii) For $s_1 \leq 1/p$, $s_2 > (1/p)$ ($s_2 \geq 1/p$ if $r = 1$), and $s_1 + s_2 > 0$, then

$$\|fg\|_{B_{p, r}^{s_1}} \leq C \|f\|_{B_{p, r}^{s_1}} \|g\|_{B_{p, r}^{s_2}}. \quad (18)$$

(iii) In Sobolev space $H^s = B_{2, 2}^s$, for $s > 0$, we have

$$\|f \partial_x g\|_{H^s} \leq C \left(\|f\|_{H^{s+1}} \|g\|_{L^\infty} + \|f\|_{L^\infty} \|\partial_x g\|_{H^s} \right). \quad (19)$$

(7) *The lifting property:* let $u \in S'(\mathbb{S})$ and $\alpha \in \mathbb{R}$; then $u \in B_{p, r}^s$ if and only if

$$\sum_{\xi \in \mathbb{Z}, \xi \neq 0} (i\xi)^\alpha \hat{u}(\xi) e^{2\pi i x \xi} \in B_{p, r}^{s-\alpha}. \quad (20)$$

Lemma 9 (see [46]). Let $1 \leq p, r \leq \infty$, $s > -\min(1/p, 1 - 1/p)$. Assume $f_0 \in B_{p, r}^s$, $F \in L^1([0, T]; B_{p, r}^s)$, and $\partial_x v \in L^1([0, T]; B_{p, r}^{s-1})$ if $s > 1 + 1/p$ or to $L^1([0, T]; B_{p, r}^{1/p} \cap L^\infty)$ otherwise. If $f \in L^\infty([0, T]; B_{p, r}^s) \cap C([0, T]; S')$ satisfies the 1-D transport equation

$$\begin{aligned} f_t + v \cdot \nabla f &= F, \\ f(t, x+1) &= f(t, x), \\ f|_{t=0} &= f_0, \end{aligned} \quad (21)$$

where $v : \mathbb{R} \times \mathbb{R}^n \rightarrow \mathbb{R}^n$ stands for a given time dependent vector field, $f_0 : \mathbb{R}^n \rightarrow \mathbb{R}^m$ and $F : \mathbb{R} \times \mathbb{R}^n \rightarrow \mathbb{R}^m$ are known data. There exists a constant C depending only on s, p , and r such that the following statements hold.

(1) If $r = 1$ or $s \neq 1 + 1/p$,

$$\begin{aligned} \|f(t)\|_{B_{p, r}^s} &\leq \|f_0\|_{B_{p, r}^s} \\ &+ \int_0^t \|F(\tau)\|_{B_{p, r}^s} d\tau + C \int_0^t V'(\tau) \|f(\tau)\|_{B_{p, r}^s} d\tau, \end{aligned} \quad (22)$$

or

$$\|f(t)\|_{B_{p, r}^s} \leq e^{CV(t)} \left[\|f_0\|_{B_{p, r}^s} + \int_0^t e^{-CV(\tau)} \|F(\tau)\|_{B_{p, r}^s} d\tau \right], \quad (23)$$

where

$$V(t) = \begin{cases} \int_0^t \|v_x(\tau)\|_{B_{p, r}^{1/p} \cap L^\infty} d\tau, \\ \quad s < 1 + \frac{1}{p}, \\ \int_0^t \|v_x(\tau)\|_{B_{p, r}^{s-1}} d\tau, \\ \quad s > 1 + \frac{1}{p} \text{ or } s = 1 + \frac{1}{p}, r = 1. \end{cases} \quad (24)$$

(2) If $s \leq 1 + 1/p$, $f_{0x} \in L^\infty$, $f_x \in L^\infty((0, T) \times \mathbb{S})$, $F_x \in L^1((0, T); L^\infty)$, then

$$\begin{aligned} \|f\|_{B_{p, r}^s} + \|f_x\|_{L^\infty} &\leq e^{CV(t)} \left[\|f_0\|_{B_{p, r}^s} + \|f_{0x}\|_{L^\infty} \right. \\ &\quad \left. + \int_0^t e^{-CV(\tau)} \left(\|F\|_{B_{p, r}^s} + \|F_x\|_{L^\infty} \right) d\tau \right], \end{aligned} \quad (25)$$

where $V(t) = \int_0^t \|\partial_x v(\tau)\|_{B_{p, r}^{1/p} \cap L^\infty} d\tau$.

(3) If $f = v$, then for all $s > 0$, (23) holds true with $V(t) = \int_0^t \|v_x(\tau)\|_{L^\infty} d\tau$.

(4) If $r < \infty$, then $f \in C([0, T]; B_{p, r}^s)$. If $r = \infty$, then $f \in C([0, T]; B_{p, 1}^{s'})$ for all $s' < s$.

Lemma 10 (see [46]). Let p, r, s, f_0, F be defined as in Lemma 9. Assume $v \in L^p([0, T]; B_{\infty, \infty}^{-M})$ for some $\rho > 1$, $M > 0$. $v_x \in L^1([0, T]; B_{p, r}^{s-1})$ if $s > 1 + 1/p$ or $s = 1 + 1/p$, $r = 1$; and $v_x \in L^1([0, T]; B_{p, \infty}^{1/p} \cap L^\infty)$ if $s < 1 + 1/p$. Then, (21) has a unique solution $f \in L^\infty([0, T]; B_{p, r}^s) \cap (\cap_{s' < s} C([0, T]; B_{p, 1}^{s'}))$ and (23) holds true. If $r < \infty$, then $f \in C([0, T]; B_{p, r}^s)$.

Lemma 11 (see [32]). Let $0 < \sigma < 1$. Assume $f_0 \in H^\sigma$, $F \in L^1([0, T]; H^\sigma)$, v and $\partial_x v \in L^1([0, T]; L^\infty)$. If $f \in L^\infty([0, T]; H^\sigma) \cap C([0, T]; S')$ satisfies (21), then $f \in C([0, T]; H^\sigma)$, and there exists a constant C depending only on σ such that the statements hold:

$$\begin{aligned} \|f(t)\|_{H^\sigma} &\leq \|f_0\|_{H^\sigma} + C \int_0^t \|F(\tau)\|_{H^\sigma} d\tau \\ &+ C \int_0^t V'(\tau) \|f(\tau)\|_{H^\sigma} d\tau, \end{aligned} \quad (26)$$

or

$$\|f(t)\|_{H^s} \leq e^{CV(t)} \left[\|f_0\|_{H^s} + \int_0^t \|F(\tau)\|_{H^s} d\tau \right], \quad (27)$$

where $V(t) = \int_0^t (\|v(\tau)\|_{L^\infty} + \|\partial_x v(\tau)\|_{L^\infty}) d\tau$.

3. The Proof of Theorem 1

We finish the proof with two subsections.

3.1. Existence of Solutions. We use a standard iterative process to construct approximate solutions to system (6).

Step 1. Starting from $u^0 = \rho^0 = 0$, we define by induction a sequence of smooth functions $(u^i, \rho^i)_{i \in \mathbb{N}} \in C(\mathbb{R}^+; B_{p,r}^\infty(\mathbb{S}))^2$ satisfying

$$(\partial_t + u^i \partial_x) u^{i+1} = F(t, x), \quad t > 0, \quad x \in \mathbb{S},$$

$$(\partial_t + u^i \partial_x) \rho^{i+1} = F_0(t, x), \quad t > 0, \quad x \in \mathbb{S},$$

$$u^{i+1}(t, x) = u^{i+1}(t, x+1), \quad \rho^{i+1}(t, x) = \rho^{i+1}(t, x+1), \\ t \geq 0, \quad x \in \mathbb{S},$$

$$u^{i+1}(0, x) = u_0^{i+1}(x) = S_{i+1} u_0,$$

$$\eta^{i+1}(0, x) = \eta_0^{i+1}(x) = S_{i+1} \eta_0,$$

$$x \in \mathbb{S}, \quad (28)$$

where $F(t, x) = P(D)[(3/2)(u^i)^2 + (c/2)(\rho^i)^2] - \lambda_1 u^i$, $F_0(t, x) = -2\partial_x u^i \rho^i - \lambda \rho^i$.

Since all the data $S_{i+1} u_0, S_{i+1} \rho_0 \in B_{p,r}^\infty$, Lemma 10 enables us to show that, for all $i \in \mathbb{N}$, system (28) has a global solution which belongs to $C(\mathbb{R}^+; B_{p,r}^\infty(\mathbb{S}))^2$.

Step 2. Now we are in the position to prove that $(u^i, \rho^i)_{i \in \mathbb{N}}$ is uniformly bounded in $E_{p,r}^s(T) \times E_{p,r}^{s-1}(T)$.

According to Lemma 9, for all $i \in \mathbb{N}$, one has

$$\begin{aligned} \|u^{i+1}\|_{B_{p,r}^s} &\leq e^{C_1 \int_0^t \|u^i\|_{B_{p,r}^s} d\tau} \\ &\times \left[\|u_0\|_{B_{p,r}^s} + \int_0^t e^{-C_1 \int_0^\tau \|u^i\|_{B_{p,r}^s} d\xi} \|F(\tau)\|_{B_{p,r}^s} d\tau \right], \\ \|\rho^{i+1}\|_{B_{p,r}^{s-1}} &\leq e^{C_2 \int_0^t \|u^i\|_{B_{p,r}^s} d\tau} \\ &\times \left[\|\rho_0\|_{B_{p,r}^{s-1}} + \int_0^t e^{-C_2 \int_0^\tau \|u^i\|_{B_{p,r}^s} d\xi} \|F_0(\tau)\|_{B_{p,r}^{s-1}} d\tau \right]. \end{aligned} \quad (29)$$

We know if $\max(3/2, 1 + 1/p) < s \leq 2 + 1/p$, then $B_{p,r}^{s-1}$ is an algebra. And if $s > 2 + 1/p$, then $B_{p,r}^{s-2}$ is an algebra. Moreover, combining (7) of Proposition 8 and

$$\begin{aligned} P(D) u(x) &= \sum_{\xi \in \mathbb{Z}} e^{2\pi i x \xi} \widehat{P(D) u}(\xi) \\ &= \sum_{\xi \in \mathbb{Z}} e^{2\pi i x \xi} \frac{2\pi i \xi}{1 + 4\pi^2 \xi^2} \widehat{u}(\xi), \end{aligned} \quad (30)$$

one deduces

$$\|P(D) u\|_{B_{p,r}^{s+1}} \leq C \|u\|_{B_{p,r}^s} \quad \text{if } u \in B_{p,r}^s. \quad (31)$$

Using (6) of Proposition 8 yields

$$\begin{aligned} \|F(t, x)\|_{B_{p,r}^s} &\leq C \left(\|u^i\|_{B_{p,r}^s}^2 + \|\rho^i\|_{B_{p,r}^{s-1}}^2 + \|u^i\|_{B_{p,r}^s} \right), \\ \|F_0(t, x)\|_{B_{p,r}^{s-1}} &\leq C \left(\|u^i\|_{B_{p,r}^s} \|\rho^i\|_{B_{p,r}^{s-1}} + \|\rho^i\|_{B_{p,r}^{s-1}} \right). \end{aligned} \quad (32)$$

Therefore, from (29) to (32), one gets

$$\begin{aligned} \|u^{i+1}\|_{B_{p,r}^s} + \|\rho^{i+1}\|_{B_{p,r}^{s-1}} &\leq C_3 \cdot e^{C_3 \int_0^t \|u^i\|_{B_{p,r}^s} d\tau} \\ &\times \left[(\|u_0\|_{B_{p,r}^s} + \|\rho_0\|_{B_{p,r}^{s-1}}) \right. \\ &\left. + \int_0^t e^{-C_3 \int_0^\tau \|u^i\|_{B_{p,r}^s} d\xi} \left(\|u^i\|_{B_{p,r}^s} + \|\rho^i\|_{B_{p,r}^{s-1}} + 1 \right) \right. \\ &\left. \times \left(\|u^i\|_{B_{p,r}^s} + \|\rho^i\|_{B_{p,r}^{s-1}} \right) d\tau \right]. \end{aligned} \quad (33)$$

Let us choose a $T > 0$ such that $2C_3^2(\|u_0\|_{B_{p,r}^s} + \|\rho_0\|_{B_{p,r}^{s-1}} + 1)T < 1$ and

$$1 + \|u^i\|_{B_{p,r}^s} + \|\rho^i\|_{B_{p,r}^{s-1}} \leq \frac{C_3 (1 + \|u_0\|_{B_{p,r}^s} + \|\rho_0\|_{B_{p,r}^{s-1}})}{1 - 2C_3^2 (1 + \|u_0\|_{B_{p,r}^s} + \|\rho_0\|_{B_{p,r}^{s-1}}) t}. \quad (34)$$

Plugging (34) into (33) yields

$$\begin{aligned} 1 + \|u^{i+1}\|_{B_{p,r}^s} + \|\rho^{i+1}\|_{B_{p,r}^{s-1}} &\leq \frac{C_3 (1 + \|u_0\|_{B_{p,r}^s} + \|\rho_0\|_{B_{p,r}^{s-1}})}{1 - 2C_3^2 (1 + \|u_0\|_{B_{p,r}^s} + \|\rho_0\|_{B_{p,r}^{s-1}}) t}. \end{aligned} \quad (35)$$

Therefore, $(u^i, \rho^i)_{i \in \mathbb{N}}$ is uniformly bounded in $C([0, T]; B_{p,r}^s(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-1}(\mathbb{S}))$. From Proposition 8 and the embedding properties

$$B_{p,r}^s \hookrightarrow B_{p,r}^{s-1}, \quad B_{p,r}^{s-1} \hookrightarrow B_{p,r}^{s-2}, \quad (36)$$

one obtains

$$\begin{aligned} \|u^i \partial_x u^{i+1}\|_{B_{p,r}^{s-1}} &\leq \|u^i\|_{B_{p,r}^{s-1}} \|\partial_x u^{i+1}\|_{B_{p,r}^{s-1}} \leq \|u^i\|_{B_{p,r}^s} \|u^{i+1}\|_{B_{p,r}^s}, \\ \|u^i \partial_x \rho^{i+1}\|_{B_{p,r}^{s-2}} &\leq \|u^i\|_{B_{p,r}^{s-1}} \|\partial_x \rho^{i+1}\|_{B_{p,r}^{s-2}} \leq \|u^i\|_{B_{p,r}^s} \|\rho^{i+1}\|_{B_{p,r}^{s-1}}. \end{aligned} \quad (37)$$

Thus, we conclude that $u^i u_x^{i+1}$ and $F(t, x)$ are uniformly bounded in $C([0, T]; B_{p,r}^{s-1}(\mathbb{S}))$. In the same way we have that $u^i \rho_x^{i+1}$ and $F_0(t, x)$ are uniformly bounded in $C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$. Using (28), one obtains that $(\partial_t u^{i+1}, \partial_t \rho^{i+1}) \in C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$ is uniformly bounded, which yields that $(u^i, \rho^i)_{i \in \mathbb{N}}$ is uniformly bounded in $E_{p,r}^s(T) \times E_{p,r}^{s-1}(T)$.

Step 3. We demonstrate that $(u^i, \rho^i)_{i \in \mathbb{N}}$ is a Cauchy sequence in $C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$.

In fact, according to (28), for all $i, j \in \mathbb{N}$, one has

$$\begin{aligned} &(\partial_t + u^{i+j} \partial_x)(u^{i+j+1} - u^{i+1}) \\ &= (u^i - u^{i+j}) \partial_x u^{i+1} + P(D) \\ &\quad \times \left[\frac{3}{2} (u^{i+j} - u^i) \times (u^{i+j} + u^i) + \frac{c}{2} (\rho^{i+j} - \rho^i) (\rho^{i+j} + \rho^i) \right] \\ &\quad - \lambda_1 (u^{i+j} - u^i), \end{aligned} \quad (38)$$

$$\begin{aligned} &(\partial_t + u^{i+j} \partial_x)(\rho^{i+j+1} - \rho^{i+1}) \\ &= (u^i - u^{i+j}) \partial_x \rho^{i+1} - 2(\rho^{i+j} - \rho^i) \partial_x u^i \\ &\quad - 2\rho^{i+j} \partial_x (u^{i+j} - u^i) - \lambda (\rho^{i+j} - \rho^i). \end{aligned} \quad (39)$$

(1) For the case $s \neq 2 + 1/p$, firstly, we estimate the right side of (38). From (17) and (18), we obtain

$$\begin{aligned} \|(u^i - u^{i+j}) \partial_x u^{i+1}\|_{B_{p,r}^{s-1}} &\leq C \|u^{i+j} - u^i\|_{B_{p,r}^{s-1}} \|\partial_x u^{i+1}\|_{B_{p,r}^{s-1}}, \\ \|P(D)(u^{i+j} - u^i)(u^{i+j} + u^i)\|_{B_{p,r}^{s-1}} \\ &\leq C \|u^{i+j} - u^i\|_{B_{p,r}^{s-1}} \|u^{i+j} + u^i\|_{B_{p,r}^{s-1}}, \\ \|P(D)[(\rho^{i+j} - \rho^i)(\rho^{i+j} + \rho^i)]\|_{B_{p,r}^{s-1}} \\ &\leq C \|\rho^{i+j} - \rho^i\|_{B_{p,r}^{s-2}} \|\rho^{i+j} + \rho^i\|_{B_{p,r}^{s-1}}, \\ \|\lambda_1 (u^{i+j} - u^i)\|_{B_{p,r}^{s-1}} &\leq C \lambda_1 \|u^{i+j} - u^i\|_{B_{p,r}^{s-1}}. \end{aligned} \quad (40)$$

Secondly, we estimate the right side of (39). Using (18), one gets

$$\begin{aligned} \|(u^i - u^{i+j}) \partial_x \rho^{i+1}\|_{B_{p,r}^{s-2}} &\leq C \|u^{i+j} - u^i\|_{B_{p,r}^{s-1}} \|\partial_x \rho^{i+1}\|_{B_{p,r}^{s-2}}, \\ \|(\rho^{i+j} - \rho^i) \partial_x u^i\|_{B_{p,r}^{s-2}} &\leq C \|\rho^{i+j} - \rho^i\|_{B_{p,r}^{s-2}} \|\partial_x u^i\|_{B_{p,r}^{s-1}}, \\ \|\rho^{i+j} \partial_x (u^{i+j} - u^i)\|_{B_{p,r}^{s-2}} &\leq C \|\partial_x (u^{i+j} - u^i)\|_{B_{p,r}^{s-2}} \|\rho^{i+j}\|_{B_{p,r}^{s-1}}. \end{aligned} \quad (41)$$

For all $t \in [0, T]$, it is deduced from Lemma 9 that

$$\begin{aligned} &\|u^{i+j+1} - u^{i+1}\|_{B_{p,r}^{s-1}} \\ &\leq e^{C \int_0^t \|u^{i+j}\|_{B_{p,r}^s} d\tau} \\ &\quad \times \left\{ \|u_0^{i+j+1} - u_0^{i+1}\|_{B_{p,r}^{s-1}} \right. \\ &\quad \left. + C \int_0^t e^{-C \int_0^\tau \|u^{i+j}\|_{B_{p,r}^s} d\xi} \right. \\ &\quad \times \left[\|\rho^{i+j} - \rho^i\|_{B_{p,r}^{s-2}} \right. \\ &\quad \times \left(\|\rho^{i+j}\|_{B_{p,r}^{s-1}} + \|\rho^i\|_{B_{p,r}^{s-1}} \right) + \|u^{i+j} - u^i\|_{B_{p,r}^{s-1}} \\ &\quad \times \left(\|u^i\|_{B_{p,r}^s} + \|u^{i+j}\|_{B_{p,r}^s} \right. \\ &\quad \left. \left. + \|u^{i+1}\|_{B_{p,r}^s} + \lambda_1 \right) \right] d\tau \left. \right\}, \end{aligned} \quad (42)$$

$$\begin{aligned} &\|\rho^{i+j+1} - \rho^{i+1}\|_{B_{p,r}^{s-2}} \\ &\leq e^{C \int_0^t \|u^{i+j}\|_{B_{p,r}^s} d\tau} \\ &\quad \times \left\{ \|\rho_0^{i+j+1} - \rho_0^{i+1}\|_{B_{p,r}^{s-2}} \right. \\ &\quad \left. + C \int_0^t e^{-C \int_0^\tau \|u^{i+j}\|_{B_{p,r}^s} d\xi} \right. \\ &\quad \times \left[\|u^{i+j} - u^i\|_{B_{p,r}^{s-1}} \right. \\ &\quad \times \left(\|\rho^{i+1}\|_{B_{p,r}^{s-1}} + \|\rho^{i+j}\|_{B_{p,r}^{s-1}} \right) + \|\rho^{i+j} - \rho^i\|_{B_{p,r}^{s-2}} \\ &\quad \times \left(\|u^i\|_{B_{p,r}^s} + \lambda \right) \left. \right] d\tau \left. \right\}. \end{aligned} \quad (43)$$

Since $(u^i, \rho^i)_{i \in \mathbb{N}}$ is uniformly bounded in $E_{p,r}^s(T) \times E_{p,r}^{s-1}(T)$ and

$$u_0^{i+j+1} - u_0^{i+1} = \sum_{q=i+1}^{i+j} \Delta_q u_0, \quad \rho_0^{i+j+1} - \rho_0^{i+1} = \sum_{q=i+1}^{i+j} \Delta_q \rho_0, \quad (44)$$

there exists a constant C_T independent of i, j such that for all $t \in [0, T]$

$$\begin{aligned} & \|u^{i+j+1} - u^{i+1}\|_{B_{p,r}^{s-1}} + \|\rho^{i+j+1} - \rho^{i+1}\|_{B_{p,r}^{s-2}} \\ & \leq C_T \left[2^{-i} + \int_0^t \left(\|u^{i+j} - u^i\|_{B_{p,r}^{s-1}} + \|\rho^{i+j} - \rho^i\|_{B_{p,r}^{s-2}} \right) d\tau \right]. \end{aligned} \quad (45)$$

By induction, one obtains

$$\begin{aligned} & \|u^{i+j+1} - u^{i+1}\|_{L_T^\infty(B_{p,r}^{s-1})} + \|\rho^{i+j+1} - \rho^{i+1}\|_{L_T^\infty(B_{p,r}^{s-2})} \\ & \leq \frac{(C_T T)^{i+1}}{(i+1)!} \left[\|u^j\|_{L^\infty([0,T]; B_{p,r}^{s-1})} + \|\rho^j\|_{L^\infty([0,T]; B_{p,r}^{s-2})} \right] \\ & \quad + C_T \sum_{l=0}^i 2^{-(i-l)} \frac{(C_T T)^l}{l!}. \end{aligned} \quad (46)$$

Since $\|u^j\|_{L_T^\infty(B_{p,r}^s)}$, $\|\rho^j\|_{L_T^\infty(B_{p,r}^{s-1})}$ are bounded independent of j , there exists a new constant C_{T_1} such that

$$\|u^{i+j+1} - u^{i+1}\|_{L_T^\infty(B_{p,r}^{s-1})} + \|\rho^{i+j+1} - \rho^{i+1}\|_{L_T^\infty(B_{p,r}^{s-2})} \leq C_{T_1} 2^{-i}. \quad (47)$$

Consequently, $(u^i, \rho^i)_{i \in \mathbb{N}}$ is a Cauchy sequence in $C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$.

(2) For the case $s = 2 + 1/p$, using (4) of Proposition 8, one has

$$\begin{aligned} & \|u^{i+j+1} - u^{i+1}\|_{L_T^\infty(B_{p,r}^{s-1})} \\ & = \|u^{i+j+1} - u^{i+1}\|_{L_T^\infty(B_{p,r}^{1+1/p})} \\ & \leq \|u^{i+j+1} - u^{i+1}\|_{L_T^\infty(B_{p,r}^{s_1})}^\theta \|u^{i+j+1} - u^{i+1}\|_{L_T^\infty(B_{p,r}^{s_2})}^{1-\theta} \\ & \leq \|u^{i+j+1} - u^{i+1}\|_{B_{p,r}^{1+1/p}}^\theta \left[\|u^{i+j+1}\|_{B_{p,r}^{2+1/p}} + \|u^{i+1}\|_{B_{p,r}^{2+1/p}} \right]^{1-\theta} \\ & \leq (C'_T)^\theta 2^{-\theta i} \left[\|u^{i+j+1}\|_{B_{p,r}^{2+1/p}} + \|u^{i+1}\|_{B_{p,r}^{2+1/p}} \right]^{1-\theta}, \end{aligned} \quad (48)$$

where $s_1 \in (\max(1 + 1/p, 3/2) - 1, 1 + 1/p)$, $s_2 \in (1 + 1/p, 2 + 1/p)$, and

$$\begin{aligned} & \|\rho^{i+j+1} - \rho^{i+1}\|_{L_T^\infty(B_{p,r}^{s-2})} \\ & = \|\rho^{i+j+1} - \rho^{i+1}\|_{L_T^\infty(B_{p,r}^{1/p})} \\ & \leq \|\rho^{i+j+1} - \rho^{i+1}\|_{L_T^\infty(B_{p,r}^{s_3})}^{\theta_1} \|\rho^{i+j+1} - \rho^{i+1}\|_{L_T^\infty(B_{p,r}^{s_4})}^{1-\theta_1} \\ & \leq \|\rho^{i+j+1} - \rho^{i+1}\|_{B_{p,r}^{1/p}}^{\theta_1} \left[\|\rho^{i+j+1}\|_{B_{p,r}^{1+1/p}} + \|\rho^{i+1}\|_{B_{p,r}^{1+1/p}} \right]^{1-\theta_1} \\ & \leq (C'_T)^{\theta_1} 2^{-\theta_1 i} \left[\|\rho^{i+j+1}\|_{B_{p,r}^{1+1/p}} + \|\rho^{i+1}\|_{B_{p,r}^{1+1/p}} \right]^{1-\theta_1}, \end{aligned} \quad (49)$$

where $s_3 \in (\max(1 + 1/p, 3/2) - 2, 1/p)$, $s_4 \in (1/p, 1 + 1/p)$.

One deduces that $(u^i, \rho^i)_{i \in \mathbb{N}}$ is a Cauchy sequence in $C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$ for the critical case.

Step 4. We end the proof of existence of solutions.

Firstly, since $(u^i, \rho^i)_{i \in \mathbb{N}}$ is uniformly bounded in $L^\infty([0, T]; B_{p,r}^s(\mathbb{S})) \times L^\infty([0, T]; B_{p,r}^{s-1}(\mathbb{S}))$, according to Fatou's Lemma in Besov space, it guarantees that (u, ρ) belongs to $L^\infty([0, T]; B_{p,r}^s(\mathbb{S})) \times L^\infty([0, T]; B_{p,r}^{s-1}(\mathbb{S}))$.

Secondly, since $(u^i, \rho^i)_{i \in \mathbb{N}}$ is a Cauchy sequence in $C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$, it converges to limit function $(u, \rho) \in C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$. An interpolation argument insures that the convergence holds in $C([0, T]; B_{p,r}^{s'}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s'-1}(\mathbb{S}))$ for any $s' < s$. Taking the limit in (28) derives that (u, ρ) is indeed a solution to (6). Thanks to the fact $(u, \rho) \in L^\infty([0, T]; B_{p,r}^s(\mathbb{S})) \times L^\infty([0, T]; B_{p,r}^{s-1}(\mathbb{S}))$, we know that the right side of the first equation in (6) belongs to $L^\infty([0, T]; B_{p,r}^s(\mathbb{S}))$, and the right side of the second equation in (6) belongs to $L^\infty([0, T]; B_{p,r}^{s-1}(\mathbb{S}))$. For the case $r < \infty$, applying Lemma 9 derives $(u, \rho) \in C([0, T]; B_{p,r}^{s'}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s'-1}(\mathbb{S}))$ for any $s' < s$.

Finally, from (6), one has $(u_t, \rho_t) \in C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$ if $r < \infty$, and in $L^\infty([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times L^\infty([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$ otherwise. Thus $(u, \rho) \in E_{p,r}^s(T) \times E_{p,r}^{s-1}(T)$. A standard use of a sequence of viscosity approximate solutions $(u_\varepsilon, \rho_\varepsilon)_{\varepsilon > 0}$ for (6) which converges uniformly in $C([0, T]; B_{p,r}^s(\mathbb{S})) \cap C^1([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \cap C^1([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$ gives the continuity of solution $(u, \rho) \in E_{p,r}^s(T) \times E_{p,r}^{s-1}(T)$.

3.2. Uniqueness and Continuity with Initial Data

Lemma 12. Let $1 \leq p, r \leq \infty$, $s > \max(1 + 1/p, 3/2)$. Assume that (u^1, ρ^1) and (u^2, ρ^2) are two given solutions to the Cauchy problem (6) with initial data $(u_0^1, \rho_0^1), (u_0^2, \rho_0^2) \in B_{p,r}^s(\mathbb{S}) \times B_{p,r}^{s-1}(\mathbb{S})$ satisfying $u^1, u^2 \in L^\infty([0, T]; B_{p,r}^s(\mathbb{S})) \cap$

$C([0, T]; B_{p,r}^{s-1}(\mathbb{S}))$, and $\rho^1, \rho^2 \in L^\infty([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \cap C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$. Then, for all $t \in [0, T]$,

$$\begin{aligned} & \|u^1 - u^2\|_{B_{p,r}^{s-1}} + \|\rho^1 - \rho^2\|_{B_{p,r}^{s-2}} \\ & \leq \left(\|u_0^1 - u_0^2\|_{B_{p,r}^{s-1}} + \|\rho_0^1 - \rho_0^2\|_{B_{p,r}^{s-2}} \right) \\ & \quad \times e^{C \int_0^t (\|u^1\|_{B_{p,r}^s} + \|u^2\|_{B_{p,r}^s} + 1) + (\|\rho^1\|_{B_{p,r}^{s-1}} + \|\rho^2\|_{B_{p,r}^{s-1}})} d\tau}. \end{aligned} \quad (50)$$

Proof. Let $u^{12} = u^2 - u^1$, $\rho^{12} = \rho^2 - \rho^1$; then

$$\begin{aligned} u^{12} & \in L^\infty([0, T]; B_{p,r}^s(\mathbb{S})) \cap C([0, T]; B_{p,r}^{s-1}(\mathbb{S})), \\ \rho^{12} & \in L^\infty([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \cap C([0, T]; B_{p,r}^{s-2}(\mathbb{S})), \end{aligned} \quad (51)$$

which derives that $(u^{12}, \rho^{12}) \in C([0, T]; B_{p,r}^{s-1}(\mathbb{S})) \times C([0, T]; B_{p,r}^{s-2}(\mathbb{S}))$, and (u^{12}, ρ^{12}) satisfies the transport equation

$$\partial_t u^{12} + u^1 \partial_x u^{12} = -u^{12} \partial_x u^2 + F_1(t, x),$$

$$t > 0, \quad x \in \mathbb{S},$$

$$\partial_t \rho^{12} + u^1 \partial_x \rho^{12} = F_2(t, x),$$

$$t > 0, \quad x \in \mathbb{S},$$

$$u^{12}(t, x) = u^{12}(t, x + 1), \quad \rho^{12}(t, x) = \rho^{12}(t, x + 1),$$

$$t \geq 0, \quad x \in \mathbb{S},$$

$$u^{12}(0, x) = u_0^{12} = u_0^2 - u_0^1, \quad \eta^{12}(0, x) = \eta_0^{12} = \eta_0^2 - \eta_0^1,$$

$$x \in \mathbb{S}, \quad (52)$$

where

$$\begin{aligned} F_1(t, x) &= P(D) \left[\frac{3}{2} u^{12} (u^1 + u^2) + \frac{c}{2} \rho^{12} (\rho^1 + \rho^2) \right] \\ &\quad - \lambda_1 u^{12}, \end{aligned} \quad (53)$$

$$F_2(t, x) = -u^{12} \partial_x \rho^2 - 2(\partial_x u^1 \rho^{12} + \partial_x u^{12} \rho^2) - \lambda \rho^{12}.$$

According to Lemma 9, one deduces

$$\begin{aligned} & e^{-C \int_0^t \|\partial_x u^1\|_{B_{p,r}^{s-1}} d\tau} \|u^{12}\|_{B_{p,r}^{s-1}} \\ & \leq \|u_0^{12}\|_{B_{p,r}^{s-1}} + C \int_0^t e^{-C \int_0^\tau \|\partial_x u^1\|_{B_{p,r}^{s-1}} d\xi} \\ & \quad \times \left(\|u^{12} \partial_x u^2\|_{B_{p,r}^{s-1}} + \|F_1\|_{B_{p,r}^{s-1}} \right) d\tau, \end{aligned} \quad (54)$$

$$\begin{aligned} & e^{-C \int_0^t \|\partial_x u^1\|_{B_{p,r}^{s-1}} d\tau} \|\rho^{12}\|_{B_{p,r}^{s-2}} \\ & \leq \|\rho_0^{12}\|_{B_{p,r}^{s-2}} + C \int_0^t e^{-C \int_0^\tau \|\partial_x u^1\|_{B_{p,r}^{s-1}} d\xi} \|F_2\|_{B_{p,r}^{s-2}} d\tau. \end{aligned} \quad (55)$$

Similar to the arguments in Step 3 in Section 3.1, one derives

$$\begin{aligned} & e^{-C \int_0^t \|\partial_x u^1\|_{B_{p,r}^{s-1}} d\tau} \left(\|u^{12}\|_{B_{p,r}^{s-1}} + \|\rho^{12}\|_{B_{p,r}^{s-2}} \right) \\ & \leq \left(\|u_0^{12}\|_{B_{p,r}^{s-1}} + \|\rho_0^{12}\|_{B_{p,r}^{s-2}} \right) \\ & \quad + C \int_0^t e^{-C \int_0^\tau \|\partial_x u^1\|_{B_{p,r}^{s-1}} d\xi} \left(\|u^{12}\|_{B_{p,r}^{s-1}} + \|\rho^{12}\|_{B_{p,r}^{s-2}} \right) \\ & \quad \times \left(1 + \|u^1\|_{B_{p,r}^s} + \|u^2\|_{B_{p,r}^s} + \|\rho^1\|_{B_{p,r}^{s-1}} + \|\rho^2\|_{B_{p,r}^{s-1}} \right) d\tau. \end{aligned} \quad (56)$$

Applying Gronwall's inequality completes the proof of Lemma 12. $\square$

Remark 13. For the critical case $s = 2 + 1/p$, the proof is similar to Step 3 in Section 3.1.

Remark 14. Note that, for every $s \in \mathbb{R}$, $B_{2,2}^s = H^s$. The existence time of system (1) may be chosen independently of s in the following sense [50]. If $(u, \rho) \in C([0, T]; H^s) \cap C^1([0, T]; H^{s-1}) \times C([0, T]; H^{s-1}) \cap C^1([0, T]; H^{s-2})$ is a solution to system (1) with initial data $(u_0, \rho_0) \in H^r \times H^{r-1}$ for some $r > 3/2, r \neq s$, then $(u, \rho) \in C([0, T]; H^r) \cap C^1([0, T]; H^{r-1}) \times C([0, T]; H^{r-1}) \cap C^1([0, T]; H^{r-2})$ with the same time T . In particular, if $(u, \rho) \in H^\infty \times H^\infty$, then $(u, \rho) \in C([0, T]; H^\infty) \times C([0, T]; H^\infty)$.

4. Wave-Breaking Phenomena

This section is devoted to investigating conditions of wave breaking mechanisms of strong solutions to system (1). Using Theorem 1 and a simple density argument, we deduce that the desired results are valid for $s \geq 3$. Here we take $s = 3$ in the proof for simplicity. We begin with three lemmas.

Lemma 15 (see [51]). *Let $T > 0$ and $u \in C^1([0, T]; H^2(\mathbb{S}))$. Then for all $t \in [0, T]$ there exists at least one point $\xi(t) \in \mathbb{S}$, such that*

$$m(t) = \inf_{x \in \mathbb{S}} u_x(t, x) = u_x(t, \xi(t)). \quad (57)$$

The function $m(t)$ is absolutely continuous on $[0, T]$ with

$$\frac{d}{dt} m(t) = u_{xt}(t, \xi(t)) \quad \text{a.e. on } [0, T]. \quad (58)$$

We consider the trajectory equation

$$\begin{aligned} & \frac{d}{dt} q(t, x) = u(t, q(t, x)), \quad t \in [0, T], \\ & q(0, x) = x, \quad x \in \mathbb{S}, \end{aligned} \quad (59)$$

where u denotes the first component of solution (u, ρ) to system (1).

Lemma 16 (see [52]). Let $u \in C([0, T]; H^s(\mathbb{S})) \cap C^1([0, T]; H^{s-1}(\mathbb{S}))$ with $s \geq 2$. Then (59) has a unique solution $q \in C^1([0, T] \times \mathbb{S}, \mathbb{S})$. Moreover, the map $q(t, \cdot)$ is an increasing diffeomorphism of $\mathbb{S}$ for all $t \in [0, T]$ and

$$q_x(t, x) = e^{\int_0^t u_x(\tau, q(\tau, x)) d\tau} > 0, \quad \forall (t, x) \in [0, T] \times \mathbb{S}. \quad (60)$$

Lemma 17. Let $(u_0, \rho_0) \in H^s(\mathbb{S}) \times H^{s-1}(\mathbb{S})$ with $s > 3/2$ and $T > 0$ is the maximal existence time of corresponding solution (u, ρ) to (6). Then for all $(t, x) \in [0, T] \times \mathbb{S}$

$$\rho(t, q(t, x)) q_x^2(t, x) = \rho_0(x) e^{-\lambda t}. \quad (61)$$

Moreover, if there exists $M > 0$ such that $u_x(t, x) \geq -M$ for all $(t, x) \in [0, T] \times \mathbb{S}$, then for all $t \in [0, T]$,

$$\begin{aligned} \|\rho(t, \cdot)\|_{L^\infty} &\leq e^{(2M-\lambda)t} \|\rho_0\|_{H^{s-1}}, \\ \|\rho(t, \cdot)\|_{L^2} &\leq e^{(2M-\lambda)t} \|\rho_0\|_{H^{s-1}}. \end{aligned} \quad (62)$$

Proof of Lemma 17. Differentiating the left side of (61) with respect to t , using (59) and the second equation in (1), we obtain

$$\begin{aligned} \frac{d}{dt} [\rho(t, q(t, x)) q_x^2(t, x)] &= (\rho_t(t, q) + \rho_x(t, q) q_t(t, x)) q_x^2(t, x) \\ &\quad + 2\rho(t, q) q_x(t, x) q_{xt}(t, x) \\ &= [\rho_t(t, q) + \rho_x(t, q) u(t, q) + 2\rho(t, q) u_x(t, q)] q_x^2(t, x) \\ &= -\lambda \rho(t, q(t, x)) q_x^2(t, x). \end{aligned} \quad (63)$$

Applying Gronwall's inequality and (59) yields (61).

From Lemma 16, (61) and the assumption in Lemma 17, one deduces

$$\begin{aligned} \|\rho(t, \cdot)\|_{L^\infty} &= \|\rho(t, q(t, \cdot))\|_{L^\infty} = \left\| e^{-\lambda t} e^{-2 \int_0^t u_x(\tau, \cdot) d\tau} \rho_0(\cdot) \right\|_{L^\infty} \\ &\leq e^{(2M-\lambda)t} \|\rho_0(\cdot)\|_{L^\infty}, \\ \int_{\mathbb{R}} |\rho(t, x)|^2 dx &= \int_{\mathbb{R}} |\rho(t, q(t, x))|^2 q_x^2(t, x) dx \\ &= \int_{\mathbb{R}} |\rho_0(x) e^{-\lambda t}|^2 q_x^{-3}(t, x) dx \\ &\leq e^{(3M-2\lambda)t} \int_{\mathbb{R}} |\rho_0(x)|^2 dx, \quad \forall t \in [0, T]. \end{aligned} \quad (64)$$

This completes the proof of Lemma 17. $\square$

In what follows we derive the estimates for $\|u(t)\|_{L^\infty}$.

Lemma 18. Let $(u_0, \rho_0) \in H^s(\mathbb{S}) \times H^{s-1}(\mathbb{S})$ with $s > 3/2$ and T is the maximal existence time of corresponding solution (u, ρ) to system (1). Assume that there exists $M > 0$ such that $\|\rho(t, \cdot)\|_{L^\infty} \leq e^{(2M-\lambda)t} \|\rho_0\|_{H^{s-1}}$, $\|\rho(t, \cdot)\|_{L^2} \leq e^{(2M-\lambda)t} \|\rho_0\|_{H^{s-1}}$ for all $t \in [0, T]$. Then for all $t \in [0, T]$, we have

$$\begin{aligned} \|u(t)\|_{L^2}^2 &\leq [4\|u_0\|_{L^2}^2 + 2|c|Te^{(8M+4\lambda+2\lambda_1)T} \|\rho_0\|_{H^{s-1}}^4] e^{2|c|te^{2\lambda_1 T}} \\ &= H(t), \end{aligned} \quad (65)$$

$$\|u(t)\|_{L^\infty} \leq \|u_0(x)\|_{L^\infty} + e^{\lambda_1 t} t P(t), \quad (66)$$

where $P(t) = (3/4)H(t) + (1/4)|c|(e^{2Mt} \|\rho_0\|_{H^{s-1}})^2$.

Proof of Lemma 18. As mentioned before, here we assume $s = 3$ to prove Lemma 18. Let $m = (1 - \partial_x^2)u$, $w = (4 - \partial_x^2)^{-1}u$. Then we rewrite the first equation in (1) as

$$m_t + 3mu_x + m_x u + \lambda_1 m + c\rho\rho_x = 0. \quad (67)$$

Noting $(\widehat{m}_t, \widehat{w}) = (\widehat{m}, \widehat{w}_t)$ or $\int_{\mathbb{S}} m_t w dx = \int_{\mathbb{S}} m w_t dx$, one has

$$\begin{aligned} \frac{1}{2} \frac{d}{dt} \int_{\mathbb{S}} m w dx &= \frac{1}{2} \int_{\mathbb{S}} m_t w dx + \frac{1}{2} \int_{\mathbb{S}} m w_t dx = \int_{\mathbb{S}} m_t w dx \\ &= -3 \int_{\mathbb{S}} w m u_x dx - \int_{\mathbb{S}} w m_x u dx \\ &\quad - c \int_{\mathbb{S}} w \rho \rho_x dx - \lambda_1 \int_{\mathbb{S}} w m dx \\ &= - \int_{\mathbb{S}} w (mu)_x dx - 2 \int_{\mathbb{S}} w m u_x dx \\ &\quad + \frac{c}{2} \int_{\mathbb{S}} w_x \rho^2 dx - \lambda_1 \int_{\mathbb{S}} w m dx, \\ \int_{\mathbb{S}} w (mu)_x dx &= - \int_{\mathbb{S}} w_x m u dx \\ &= \int_{\mathbb{S}} w_x u^2 dx - \int_{\mathbb{S}} w_x u_x^2 dx, \\ 2 \int_{\mathbb{S}} w m u_x dx &= - \int_{\mathbb{S}} w_x u^2 dx + \int_{\mathbb{S}} w_x u_x^2 dx. \end{aligned} \quad (68)$$

Combining the above three equalities, one derives

$$\frac{d}{dt} \int_{\mathbb{S}} m w dx = -2\lambda_1 \int_{\mathbb{S}} m w dx + c \int_{\mathbb{S}} w_x \rho^2 dx. \quad (69)$$

Using Gronwall's inequality, we have

$$\begin{aligned} & \int_{\mathbb{S}} mw \, dx \\ &= e^{-2\lambda_1 t} \left[\int_{\mathbb{S}} m_0 w_0 \, dx + c \int_0^t e^{2\lambda_1 \tau} \int_{\mathbb{S}} w_x \rho^2 \, dx \, d\tau \right] \quad (70) \\ &\leq \int_{\mathbb{S}} m_0 w_0 \, dx + |c| e^{2\lambda_1 t} \int_0^t \int_{\mathbb{S}} w_x \rho^2 \, dx \, d\tau. \end{aligned}$$

Thus

$$\begin{aligned} & \|u(t)\|_{L^2}^2 \\ &= \|\widehat{u}(t)\|_{L^2}^2 \leq 4 \int_{\mathbb{S}} \frac{1 + |2\pi\xi|^2}{4 + |2\pi\xi|^2} |\widehat{u}(t, \xi)|^2 \, d\xi = 4(\widehat{m}(t), \widehat{w}(t)) \\ &= 4(m(t), w(t)) = 4(m_0, w_0) + 4|c| e^{2\lambda_1 t} \int_0^t \int_{\mathbb{S}} w_x \rho^2 \, dx \, d\tau \\ &\leq 4\|u_0\|_{L^2}^2 + 4|c| e^{2\lambda_1 t} \int_0^t \int_{\mathbb{S}} w_x \rho^2 \, dx \, d\tau. \quad (71) \end{aligned}$$

Noting

$$\|w_x(t)\|_{L^2}^2 = \|\partial_x(4 - \partial_x^2)^{-1} u(t)\|_{L^2}^2 \leq \|u(t)\|_{L^2}^2 \quad (72)$$

and using the assumption in Lemma 18, we obtain

$$\|\rho(t, \cdot)\|_{L^4}^4 = \|\rho(t, \cdot)\|_{L^\infty}^2 \|\rho(t, \cdot)\|_{L^2}^2 \leq [e^{(2M-\lambda)t} \|\rho_0\|_{H^{s-1}}]^4. \quad (73)$$

Hence

$$\begin{aligned} & \|u(t)\|_{L^2}^2 \\ &\leq 4\|u_0\|_{L^2}^2 + 2|c| e^{2\lambda_1 t} \int_0^t [\|w_x(\tau, \cdot)\|_{L^2}^2 + \|\rho(\tau, \cdot)\|_{L^4}^4] \, d\tau \\ &\leq 4\|u_0\|_{L^2}^2 + 2|c| T e^{(8M+4\lambda+2\lambda_1)t} \|\rho_0\|_{H^{s-1}}^4 \\ &\quad + 2|c| e^{2\lambda_1 t} \int_0^t \|u(\tau)\|_{L^2}^2 \, d\tau \\ &\leq 4\|u_0\|_{L^2}^2 + 2|c| T e^{(8M+4\lambda+2\lambda_1)T} \|\rho_0\|_{H^{s-1}}^4 \\ &\quad + 2|c| e^{2\lambda_1 T} \int_0^t \|u(\tau)\|_{L^2}^2 \, d\tau. \quad (74) \end{aligned}$$

Applying Gronwall's inequality yields (65).

Now we present the proof of (66). Note that, for all $x \in \mathbb{S}$, if $g(x) = \cosh(x - [x] - 1/2)/2 \sinh(1/2)$, where $[x]$ denotes the integer part of x , then $(1 - \partial_x^2)^{-1} f = g * f$ for all $f \in L^2(\mathbb{S})$. It follows from some calculations that $g(x)$ is continuous and decreasing on interval $[0, 1/2]$ and increasing on interval $[1/2, 1]$: $g(1/2) = 1/2 \sinh(1/2)$, $g(0) = g(1) = \cosh(1/2)/2 \sinh(1/2)$, $1/2 \sinh(1/2) \leq g(x) \leq$

$\cosh(1/2)/2 \sinh(1/2) = c_0$, and $\|\partial_x g\|_{L^\infty} \leq 1/2$. Applying Young's inequality, one has

$$\begin{aligned} & \left\| -\partial_x g * \left(\frac{3}{2} u^2 + \frac{1}{2} c \rho^2 \right) \right\|_{L^\infty} \leq \|\partial_x g\|_{L^\infty} \left\| \frac{3}{2} u^2 + \frac{1}{2} c \rho^2 \right\|_{L^1} \\ &\leq \frac{3}{4} \|u\|_{L^2}^2 + \frac{|c|}{4} \|\rho\|_{L^2}^2. \quad (75) \end{aligned}$$

Using (59), we obtain

$$\begin{aligned} \frac{du(t, q(t, x))}{dt} &= u_t(t, q(t, x)) + u_x(t, q(t, x)) q_t(t, x) \\ &= (u_t + uu_x)(t, q(t, x)). \end{aligned} \quad (76)$$

For the first equation in system (6), using (65) and the facts above, one derives

$$-P(t) \leq \frac{du(t, q(t, x))}{dt} + \lambda_1 u(t, q(t, x)) \leq P(t). \quad (77)$$

It follows from Gronwall's inequality that

$$|u(t, q(t, x))| \leq \|u_0(x)\|_{L^\infty} + e^{\lambda_1 t} t P(t). \quad (78)$$

From Lemma 16, we obtain (66). $\square$

Lemma 19. Let $(u_0, \rho_0) \in H^s(\mathbb{S}) \times H^{s-1}(\mathbb{S})$ with $s > 3/2$ and T is the maximal existence time of corresponding solution (u, ρ) to system (6). If $\partial_x u \in L^1([0, T]; L^\infty)$, then for all $t \in [0, T]$, we have

$$\begin{aligned} & \|u(t)\|_{L^\infty} \\ &\leq \|u_0(x)\|_{L^\infty} \\ &\quad + e^{\lambda_1 t} \left[\frac{3}{4} H_1(t) + \frac{|c|}{4} \left(e^{2 \int_0^t \|\partial_x u(\tau)\|_{L^\infty} d\tau} \|\rho_0\|_{H^{s-1}} \right)^2 \right] \\ &= L(t), \quad (79) \end{aligned}$$

where

$$\begin{aligned} & H_1(t) \\ &= \left[4\|u_0\|_{L^2}^2 + 2|c| T e^{(8 \int_0^T \|\partial_x u(\tau)\|_{L^\infty} d\tau) + (4\lambda+2\lambda_1)T} \|\rho_0\|_{H^{s-1}}^4 \right] \\ &\quad \times e^{2e^{2\lambda_1 T} |c| t}. \quad (80) \end{aligned}$$

Proof of Lemma 19. It follows from the proof of Lemma 17 that

$$\begin{aligned} & \|\rho(t, \cdot)\|_{L^\infty}, \|\rho(t, \cdot)\|_{L^2} \leq e^{-\lambda t + 2 \int_0^t \|\partial_x u(\tau)\|_{L^\infty} d\tau} \|\rho_0\|_{H^{s-1}} \\ &\leq e^{2 \int_0^t \|\partial_x u(\tau)\|_{L^\infty} d\tau} \|\rho_0\|_{H^{s-1}}. \quad (81) \end{aligned}$$

Using similar arguments as in the proof of Lemma 18, one completes the proof of Lemma 19. $\square$

4.1. The Proof of Theorem 2. We present the proof of Theorem 2 by inductive arguments with respect to the index s ($s > 3/2$).

Step 1. For $s \in (3/2, 2)$, using Lemma 11 and the second equation in (6), one obtains

$$\begin{aligned} \|\rho(t)\|_{H^{s-1}} &\leq \|\rho_0\|_{H^{s-1}} + C \int_0^t \|u_x \rho\|_{H^{s-1}} d\tau \\ &\quad + C \int_0^t \|\rho\|_{H^{s-1}} (\|u\|_{L^\infty} + \|u_x\|_{L^\infty} + \lambda) d\tau. \end{aligned} \quad (82)$$

From (17), we have

$$\|\partial_x u \rho\|_{H^{s-1}} \leq C (\|\partial_x u\|_{H^{s-1}} \|\rho\|_{L^\infty} + \|\partial_x u\|_{L^\infty} \|\rho\|_{H^{s-1}}). \quad (83)$$

Thus

$$\begin{aligned} \|\rho(t)\|_{H^{s-1}} &\leq \|\rho_0\|_{H^{s-1}} + C \int_0^t \|\partial_x u\|_{H^{s-1}} \|\rho\|_{L^\infty} d\tau \\ &\quad + C \int_0^t \|\rho\|_{H^{s-1}} (\|u\|_{L^\infty} + \|\partial_x u\|_{L^\infty} + \lambda) d\tau. \end{aligned} \quad (84)$$

On the other hand, using (3) of Lemma 9 and the first equation in (6) derives

$$\begin{aligned} \|u(t)\|_{H^s} &\leq \|u_0\|_{H^s} + C \int_0^t \left\| P(D) \left(\frac{3}{2} u^2 + \frac{c}{2} \rho^2 \right) - \lambda_1 u \right\|_{H^s} d\tau \\ &\quad + C \int_0^t \|u\|_{H^s} \|\partial_x u\|_{L^\infty} d\tau. \end{aligned} \quad (85)$$

Applying (7) of Proposition 8 yields

$$\begin{aligned} &\left\| P(D) \left(\frac{3}{2} u^2 + \frac{c}{2} \rho^2 \right) - \lambda_1 u \right\|_{H^s} \\ &\leq C \left\| \frac{3}{2} u^2 + \frac{c}{2} \rho^2 \right\|_{H^{s-1}} + C \lambda_1 \|u\|_{H^s} \\ &\leq C (\|u\|_{H^{s-1}} \|u\|_{L^\infty} + \|\rho\|_{H^{s-1}} \|\rho\|_{L^\infty} + \|u\|_{H^s}). \end{aligned} \quad (86)$$

Hence

$$\begin{aligned} \|u(t)\|_{H^s} &\leq \|u_0\|_{H^s} + C \int_0^t \|u\|_{H^s} (\|u\|_{L^\infty} + \|\partial_x u\|_{L^\infty} + 1) d\tau \\ &\quad + C \int_0^t \|\rho\|_{H^{s-1}} \|\rho\|_{L^\infty} d\tau. \end{aligned} \quad (87)$$

Combining (84) and (87), one deduces

$$\begin{aligned} \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} &\leq \|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}} \\ &\quad + C \int_0^t (\|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}}) \\ &\quad \times (\|u\|_{L^\infty} + \|\partial_x u\|_{L^\infty} + \|\rho\|_{L^\infty} + 1) d\tau. \end{aligned} \quad (88)$$

Applying Gronwall's inequality yields

$$\begin{aligned} \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} &\leq (\|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}}) e^{C \int_0^t (\|u\|_{L^\infty} + \|\partial_x u\|_{L^\infty} + \|\rho\|_{L^\infty} + 1) d\tau}. \end{aligned} \quad (89)$$

Therefore, if $T < \infty$ satisfies $\int_0^T \|\partial_x u(\tau)\|_{L^\infty} d\tau < \infty$, from (89), Lemma 19, and the fact that $\|\rho(t, \cdot)\|_{L^\infty} \leq e^2 \int_0^t \|\partial_x u(\tau)\|_{L^\infty} d\tau \|\rho_0\|_{H^{s-1}}$, we have

$$\begin{aligned} \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} &\leq (\|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}}) \\ &\quad \times e^{Ct[L(t) + e^2 \int_0^t \|\partial_x u(\tau)\|_{L^\infty} d\tau \|\rho_0\|_{H^{s-1}} + 1] + C \int_0^t \|\partial_x u\|_{L^\infty} d\tau}. \end{aligned} \quad (90)$$

Thus

$$\limsup_{t \rightarrow T^-} (\|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}}) < \infty, \quad (91)$$

which contradicts the assumption that $T < \infty$ is the maximal existence time. This completes the proof for $s \in (3/2, 2)$.

Step 2. For $s \in [2, 5/2)$, applying (1) of Lemma 9 to the second equation in (6) derives

$$\begin{aligned} \|\rho(t)\|_{H^{s-1}} &\leq \|\rho_0\|_{H^{s-1}} + C \int_0^t \|\partial_x u \rho\|_{H^{s-1}} d\tau \\ &\quad + C \int_0^t \|\rho\|_{H^{s-1}} (\|\partial_x u\|_{H^{1/2} \cap L^\infty} + \lambda) d\tau. \end{aligned} \quad (92)$$

Thus

$$\begin{aligned} \|\rho(t)\|_{H^{s-1}} &\leq \|\rho_0\|_{H^{s-1}} + C \int_0^t \|u_x\|_{H^{s-1}} \|\rho\|_{L^\infty} d\tau \\ &\quad + C \int_0^t \|\rho\|_{H^{s-1}} (\|u_x\|_{H^{1/2} \cap L^\infty} + \lambda) d\tau, \end{aligned} \quad (93)$$

which together with (87) and the fact that $H^{(1/2)+}(\mathbb{S}) \hookrightarrow H^{1/2}(\mathbb{S}) \cap L^\infty(\mathbb{S})$, makes one deduce

$$\begin{aligned} \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} &\leq \|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}} \\ &\quad + C \int_0^t (\|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}}) (\|u\|_{H^{(3/2)+}} + \|\rho\|_{L^\infty} + 1) d\tau. \end{aligned} \quad (94)$$

It follows from Gronwall's inequality that

$$\begin{aligned} \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} &\leq (\|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}}) e^{C \int_0^t (\|u\|_{H^{(3/2)+}} + \|\rho\|_{L^\infty} + 1) d\tau}. \end{aligned} \quad (95)$$

Therefore, if $T < \infty$ satisfies $\int_0^T \|\partial_x u(\tau)\|_{L^\infty} d\tau < \infty$, from (95) and $\|\rho(t, \cdot)\|_{L^\infty} \leq e^2 \int_0^t \|\partial_x u(\tau)\|_{L^\infty} d\tau \|\rho_0\|_{H^{s-1}}$, we obtain

$$\limsup_{t \rightarrow T^-} (\|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}}) < \infty, \quad (96)$$

which contradicts with the assumption that $T < \infty$ is the maximal existence time. This completes the proof for $s \in [2, 5/2)$.

Step 3. For $s \in (2, 3)$, differentiating the second equation in (6) with respect to x , we obtain

$$\partial_t \rho_x + u \partial_x \rho_x + 3u_x \rho_x + 2u_{xx} \rho + \lambda \rho_x = 0. \quad (97)$$

Using Lemma 11 derives

$$\begin{aligned} & \|\partial_x \rho(t)\|_{H^{s-2}} \\ & \leq \|\partial_x \rho_0\|_{H^{s-2}} + C \int_0^t \|3u_x \rho_x + 2u_{xx} \rho + \lambda \rho_x\|_{H^{s-2}} d\tau \\ & \quad + C \int_0^t \|\partial_x \rho\|_{H^{s-2}} (\|u\|_{L^\infty} + \|\partial_x u\|_{L^\infty}) d\tau. \end{aligned} \quad (98)$$

Thanks to (6) of Proposition 8, one obtains

$$\begin{aligned} \|u_x \rho_x\|_{H^{s-2}} & \leq C (\|\partial_x u\|_{H^{s-1}} \|\rho\|_{L^\infty} + \|\partial_x u\|_{L^\infty} \|\partial_x \rho\|_{H^{s-2}}), \\ \|\rho u_{xx}\|_{H^{s-2}} & \leq C (\|\rho\|_{H^{s-1}} \|\partial_x u\|_{L^\infty} + \|\rho\|_{L^\infty} \|u_{xx}\|_{H^{s-2}}), \\ \|\lambda \rho_x\|_{H^{s-2}} & \leq C \lambda \|\rho\|_{H^{s-1}}. \end{aligned} \quad (99)$$

Thus

$$\begin{aligned} & \|\partial_x \rho(t)\|_{H^{s-2}} \\ & \leq \|\partial_x \rho_0\|_{H^{s-2}} \\ & \quad + C \int_0^t (\|u\|_{H^s} + \|\rho\|_{H^{s-1}}) \\ & \quad \times (\|u\|_{L^\infty} + \|\partial_x u\|_{L^\infty} + \|\rho\|_{L^\infty} + 1) d\tau, \end{aligned} \quad (100)$$

which together with (87) and (84) with $s - 2$ instead of $s - 1$ derives

$$\begin{aligned} & \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} \\ & \leq \|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}} \\ & \quad + C \int_0^t (\|u\|_{H^s} + \|\rho\|_{H^{s-1}}) \\ & \quad \times (\|u\|_{L^\infty} + \|\partial_x u\|_{L^\infty} + \|\rho\|_{L^\infty} + 1) d\tau. \end{aligned} \quad (101)$$

Similar to the arguments in Step 1, one completes the proof for $s \in (2, 3)$.

Step 4. For $s = k_1 \in \mathbb{N}$ and $k_1 \geq 3$, differentiating the second equation in (6) $k_1 - 2$ times with respect to x derives

$$\begin{aligned} & (\partial_t + u \partial_x) \partial_x^{k_1-2} \rho + \sum_{l_1+l_2=k_1-3, l_1, l_2 \geq 0} C_{l_1, l_2} \partial_x^{l_1+1} u \partial_x^{l_2+1} \rho \\ & \quad + 2\rho \partial_x^{k_1-1} u + \lambda \partial_x^{k_1-2} \rho = 0. \end{aligned} \quad (102)$$

From Lemma 9, we have

$$\begin{aligned} & \|\partial_x^{k_1-2} \rho(t)\|_{H^1} \\ & \leq \|\partial_x^{k_1-2} \rho_0\|_{H^1} + C \int_0^t \|\partial_x^{k_1-2} \rho\|_{H^1} \|\partial_x u\|_{H^{1/2} \cap L^\infty} d\tau \\ & \quad + C \int_0^t \left\| \sum_{l_1+l_2=k_1-3, l_1, l_2 \geq 0} C_{l_1, l_2} \partial_x^{l_1+1} u \partial_x^{l_2+1} \rho \right. \\ & \quad \left. + 2\rho \partial_x^{k_1-1} u + \lambda \partial_x^{k_1-2} \rho \right\|_{H^1} d\tau. \end{aligned} \quad (103)$$

Using the algebraic properties of $H^1(\mathbb{S})$ derives

$$\begin{aligned} & \|\rho \partial_x^{k_1-1} u\|_{H^1} \leq C \|\rho\|_{H^1} \|\partial_x^{k_1-1} u\|_{H^1} \leq C \|\rho\|_{H^1} \|u\|_{H^s}, \\ & \left\| \sum_{l_1+l_2=k_1-3, l_1, l_2 \geq 0} C_{l_1, l_2} \partial_x^{l_1+1} u \partial_x^{l_2+1} \rho \right\|_{H^1} \leq C \|u\|_{H^{s-1}} \|\rho\|_{H^{s-1}}, \\ & \|\partial_x^{k_1-2} \rho\|_{H^1} \leq C \|\rho\|_{H^{s-1}}. \end{aligned} \quad (104)$$

Thus

$$\begin{aligned} & \|\partial_x^{k_1-2} \rho(t)\|_{H^1} \\ & \leq \|\partial_x^{k_1-2} \rho_0\|_{H^1} \\ & \quad + C \int_0^t (\|u\|_{H^s} + \|\rho\|_{H^{s-1}}) \times (\|u\|_{H^{s-1}} + \|\rho\|_{H^1} + 1) d\tau, \end{aligned} \quad (105)$$

which together with (87), (84) with $s - 1$ instead of 1 derives

$$\begin{aligned} & \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} \\ & \leq C (\|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}}) \\ & \quad + C \int_0^t (\|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}}) \\ & \quad \times (\|u(t)\|_{H^{s-1}} + \|\rho(t)\|_{H^1} + 1) d\tau. \end{aligned} \quad (106)$$

Using Gronwall's inequality, we obtain

$$\begin{aligned} & \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} \\ & \leq C (\|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}}) e^{C \int_0^t (\|u\|_{H^{s-1}} + \|\rho\|_{H^1} + 1) d\tau}. \end{aligned} \quad (107)$$

If $T < \infty$ satisfies $\int_0^T \|\partial_x u(\tau)\|_{L^\infty} d\tau < \infty$, using the uniqueness of solutions in Theorem 1, one obtains that $\|u\|_{H^{s-1}} + \|\rho\|_{H^1}$ is uniformly bounded. Then

$$\limsup_{t \rightarrow T^-} (\|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}}) < \infty, \quad (108)$$

which contradicts the assumption that the maximal existence time $T < \infty$. This completes the proof for $s = k_1 \in \mathbb{N}$ and $k_1 \geq 3$.

Step 5. For $s \in (k_1, k_1 + 1)$, $k_1 \in \mathbb{N}$ and $k_1 \geq 3$, differentiating the second equation in system (6) $k_1 - 1$ times with respect to x , we obtain

$$\begin{aligned} & (\partial_t + u\partial_x) \partial_x^{k_1-1} \rho + \sum_{l_1+l_2=k_1-2, l_1, l_2 \geq 0} C_{l_1, l_2} \partial_x^{l_1+1} u \partial_x^{l_2+1} \rho \\ & + 2\rho \partial_x^{k_1} u + \lambda \partial_x^{k_1-1} \rho = 0. \end{aligned} \quad (109)$$

Using Lemma 11 with $s - k_1 \in (0, 1)$, one derives

$$\begin{aligned} & \|\partial_x^{k_1-1} \rho(t)\|_{H^{s-k_1}} \\ & \leq \|\partial_x^{k_1-1} \rho_0\|_{H^{s-k_1}} \\ & + C \int_0^t \|\partial_x^{k_1-1} \rho\|_{H^{s-k_1}} (\|\partial_x u\|_{L^\infty} + \|u\|_{L^\infty}) d\tau \\ & + C \int_0^t \left\| \sum_{l_1+l_2=k_1-2, l_1, l_2 \geq 0} C_{l_1, l_2} \partial_x^{l_1+1} u \partial_x^{l_2+1} \rho \right. \\ & \quad \left. + 2\rho \partial_x^{k_1} u + \lambda \partial_x^{k_1-1} \rho \right\|_{H^{s-k_1}} d\tau. \end{aligned} \quad (110)$$

For sufficiently small $\varepsilon > 0$, using (19) and the fact that $H^{1/2+\varepsilon}(\mathbb{S}) \hookrightarrow L^\infty(\mathbb{S})$, one has

$$\begin{aligned} & \|\rho \partial_x^{k_1} u\|_{H^{s-k_1}} \\ & \leq C \left(\|\partial_x^{k_1} u\|_{H^{s-k_1}} \|\rho\|_{L^\infty} + \|\partial_x^{k_1-1} u\|_{L^\infty} \|\rho\|_{H^{s-k_1+1}} \right) \\ & \leq C \left(\|u\|_{H^s} \|\rho\|_{L^\infty} + \|u\|_{H^{k_1-1/2+\varepsilon}} \|\rho\|_{H^{s-k_1+1}} \right), \\ & \left\| \sum_{l_1+l_2=k_1-2, l_1, l_2 \geq 0} C_{l_1, l_2} \partial_x^{l_1+1} u \partial_x^{l_2+1} \rho \right\|_{H^{s-k_1}} \\ & \leq C \sum_{l_1+l_2=k_1-2, l_1, l_2 \geq 0} C_{l_1, l_2} \left(\|\partial_x^{l_1+1} u\|_{L^\infty} \|\partial_x^{l_2+1} \rho\|_{H^{s-k_1}} \right. \\ & \quad \left. + \|\partial_x^{l_1+1} u\|_{H^{s-k_1+1}} \|\partial_x^{l_2+1} \rho\|_{L^\infty} \right) \\ & \leq C \left(\|u\|_{H^{k_1-1/2+\varepsilon}} \|\rho\|_{H^{s-1}} + \|u\|_{H^s} \|\rho\|_{H^{k_1-3/2+\varepsilon}} \right), \\ & \|\lambda \partial_x^{k_1-1} \rho\|_{H^{s-k_1}} \leq C \|\rho\|_{H^{s-1}}. \end{aligned} \quad (111)$$

Making use of (110) and (111) yields

$$\begin{aligned} & \|\partial_x^{k_1-1} \rho(t)\|_{H^{s-k_1}} \\ & \leq \|\partial_x^{k_1-1} \rho_0\|_{H^{s-k_1}} \\ & + C \int_0^t (\|u\|_{H^s} + \|\rho\|_{H^{s-1}}) (\|u\|_{H^{k_1-1/2+\varepsilon}} + \|\rho\|_{H^{k_1-3/2+\varepsilon}} + 1) d\tau, \end{aligned} \quad (112)$$

which together with (87) and (84) with $s - k_1 \in (0, 1)$ instead of $s - 1$ derives

$$\begin{aligned} & \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} \\ & \leq C (\|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}}) \\ & + C \int_0^t (\|u\|_{H^s} + \|\rho\|_{H^{s-1}}) (\|u\|_{H^{k_1-1/2+\varepsilon}} + \|\rho\|_{H^{k_1-3/2+\varepsilon}} + 1) d\tau. \end{aligned} \quad (113)$$

Thanks to Gronwall's inequality, one has

$$\begin{aligned} & \|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}} \\ & \leq C (\|u_0\|_{H^s} + \|\rho_0\|_{H^{s-1}}) e^{C \int_0^t (\|u\|_{H^{k_1-1/2+\varepsilon}} + \|\rho\|_{H^{k_1-3/2+\varepsilon}} + 1) d\tau}. \end{aligned} \quad (114)$$

Using the uniqueness of solutions in Theorem 1, we obtain that

$$\|u\|_{H^{k_1-1/2+\varepsilon}} + \|\rho\|_{H^{k_1-3/2+\varepsilon}} \quad (115)$$

is uniformly bounded by the induction assumption. Then

$$\limsup_{t \rightarrow T^-} (\|u(t)\|_{H^s} + \|\rho(t)\|_{H^{s-1}}) < \infty, \quad (116)$$

which leads to a contradiction.

Thus from Step 1 to Step 5, one completes the proof of Theorem 2.

4.2. The Proof of Theorem 3. Using simple density arguments, here we only need to prove the theorem for $s = 3$. Assume that there exists $T > 0$ and $M > 0$ such that

$$u_x(t, x) \geq -M, \quad \forall (t, x) \in [0, T] \times \mathbb{S}. \quad (117)$$

Applying Lemma 17 yields

$$\|\rho(t, \cdot)\|_{L^\infty}, \|\rho(t, \cdot)\|_{L^2} \leq e^{2Mt} \|\rho_0\|_{H^{s-1}}, \quad \forall t \in [0, T]. \quad (118)$$

Differentiating the first equation in (6) with respect to x and using $\partial_x^2 g * f = g * f - f$ yield

$$\begin{aligned} u_{tx} = & -u_x^2 - uu_{xx} - g * \left(\frac{3}{2}u^2 + \frac{c}{2}\rho^2 \right) - \lambda_1 u_x \\ & + \left(\frac{3}{2}u^2 + \frac{c}{2}\rho^2 \right). \end{aligned} \quad (119)$$

Noting

$$\begin{aligned} \frac{du_x(t, q(t, x))}{dt} &= u_{xt}(t, q(t, x)) + u_{xx}(t, q(t, x)) q_t(t, x) \\ &= (u_{tx} + uu_{xx})(t, q(t, x)) \end{aligned} \quad (120)$$

and combining (119), (120), and $u_x^2 \geq 0$, $g * u^2 \geq 0$, $\|g * \rho^2\|_{L^\infty} \leq \|g\|_{L^1} \|\rho\|_{L^\infty}^2 \leq c_0 \|\rho\|_{L^\infty}^2$, (62), (66), one deduces

$$\begin{aligned} \frac{du_x(t, q(t, x))}{dt} &= \left[-u_x^2 - g * \left(\frac{3}{2}u^2 + \frac{c}{2}\rho^2 \right) - \lambda_1 u_x + \left(\frac{3}{2}u^2 + \frac{c}{2}\rho^2 \right) \right] (t, q) \\ &\leq \frac{|c|}{2} c_0 \|\rho\|_{L^\infty}^2 + \lambda_1 M + \frac{3}{2} \|u\|_{L^\infty}^2 + \frac{|c|}{2} \|\rho\|_{L^\infty}^2. \end{aligned} \quad (121)$$

Using Lemmas 17 and 18, one deduces that there exists $C_4 > 0$ such that

$$\frac{du_x(t, q(t, x))}{dt} \leq C_4. \quad (122)$$

For $t \in (0, T)$, integrating the above inequality with respect to t on interval $(0, t)$, we have

$$u_x(t, q(t, x)) \leq u_{0x}(x) + C_4 t. \quad (123)$$

Thus

$$\begin{aligned} \sup_{x \in \mathbb{S}} u_x(t, x) &\leq \|\partial_x u_0\|_{L^\infty} + C_4 t \leq \|u_0\|_{H^1} + C_4 T, \\ &\forall t \in [0, T], \end{aligned} \quad (124)$$

which together with (117) and $T < \infty$ derives

$$\int_0^T \|\partial_x u(\tau)\|_{L^\infty} d\tau < \infty. \quad (125)$$

This contradicts with the results in Theorem 2.

On the other hand, applying Sobolev's embedding theorem, one deduces

$$\lim_{t \rightarrow T^-} \inf_{x \in \mathbb{S}} u_x(t, x) = -\infty, \quad (126)$$

and then the solution (u, ρ) blows up in finite time. This completes the proof.

Remark 20. Theorem 3 implies that the blow-up phenomenon of solution (u, ρ) to system (6) only depends on the slope of the first component u . In other words, the first component u blows up before the second component ρ in finite time.

4.3. The Proof of Theorem 4. We use Lemmas 17 and 18 to prove Theorem 4. For simplicity, we assume $s = 3$ here. Noting the assumption u_0 is odd, ρ_0 is even, and the structure

of system (6), one deduces that $u(t, x)$ is odd and $\rho(t, x)$ is even with respect to x for all $t \in (0, T)$. Thus $u(t, 0) = 0$ and $\rho_x(t, 0) = 0$. Thanks to the second equation in system (6) at the point $x = 0$, we have

$$\begin{aligned} \frac{d}{dt} \rho(t, 0) &= [-2u_x(t, 0) - \lambda] \rho(t, 0), \quad t > 0, \quad x \in \mathbb{S}, \\ \rho(0, 0) &= 0, \quad x \in \mathbb{S}, \end{aligned} \quad (127)$$

which derives $\rho(t, 0) = 0$.

Differentiating the first equation in system (6) with respect to variable x yields

$$u_{xt} = -u_x^2 - uu_{xx} - g * \left(\frac{3}{2}u^2 + \frac{c}{2}\rho^2 \right) + \frac{3}{2}u^2 + \frac{c}{2}\rho^2 - \lambda_1 u_x. \quad (128)$$

Noting the assumption $c \geq 0$ in Theorem 4, one obtains $g * ((3/2)u^2 + (c/2)\rho^2) \geq 0$. Setting $M(t) = u_x(t, 0) + \lambda_1/2$ and combining with (128) yield

$$\frac{dM(t)}{dt} \leq -M^2(t) + \frac{\lambda_1^2}{4}. \quad (129)$$

By the assumption $M(0) = u_{0x}(0) + \lambda_1/2 < -\lambda_1/2$, we have $M^2(0) > \lambda_1^2/4$. We claim that $M(t) < -\lambda_1/2$ is true for all $t \in [0, T]$. In fact, if the claim is not true for all $t \in [0, T]$, then from the continuity of $M(t)$, we deduce that there exists $t_0 \in (0, T)$ such that $M^2(t) > \lambda_1^2/4$ for $t \in [0, t_0]$, and $M^2(t_0) = \lambda_1^2/4$. Combining this with (129) derives $dM(t)/dt < 0$ a.e. on $[0, t_0]$. Since $M(t)$ is absolutely continuous on $[0, t_0]$, one gets the contradiction $M(t_0) < M(0) = u_{0x}(x_0) + \lambda_1/2 < -\lambda_1/2$. This completes the proof of the claim.

Thus we obtain that $M(t)$ is strictly decreasing on $[0, T]$. Let $\delta \in (0, 1)$ such that $-\sqrt{\delta}M(0) = \lambda_1/2$. From (129), we have

$$\begin{aligned} \frac{dM(t)}{dt} &\leq -M^2(t) + \delta M^2(0) \\ &\leq -(1 - \delta) M^2(t) \quad \text{a.e. on } [0, T]. \end{aligned} \quad (130)$$

Since $M(t)$ is locally Lipschitz on $[0, T]$ and strictly negative, thus $1/M(t)$ is also locally Lipschitz on $[0, T]$. It follows that

$$\frac{d}{dt} \left[\frac{1}{M(t)} \right] = -\frac{1}{M^2(t)} \frac{dM(t)}{dt} \geq 1 - \delta \quad \text{a.e. on } [0, T]. \quad (131)$$

Integrating (131) with respect to t over $(0, t)$ yields

$$-\frac{1}{M(t)} + \frac{1}{M(0)} \leq -(1 - \delta)t \quad \text{a.e. on } [0, T]. \quad (132)$$

Since $M(t) < 0$ on $[0, T]$, one obtains that the maximal existence time $T \leq -1/(1 - \delta)M(0) < \infty$. Moreover, using the assumption $M(0) = u_{0x}(0) + \lambda_1/2 < 0$ derives

$$\begin{aligned} u_x(t, 0) &\leq \frac{u_{0x}(0) + \lambda_1/2}{1 + t(1 - \delta)(u_{0x}(0) + \lambda_1/2)} - \frac{\lambda_1}{2} \rightarrow -\infty, \\ t &\rightarrow -\frac{1}{(1 - \delta)(u_{0x}(0) + \lambda_1/2)}, \end{aligned} \quad (133)$$

which completes the first part proof of Theorem 4.

On the other hand, differentiating the second equation in (6) with respect to x yields

$$\frac{d\rho_x(t, q(t, x))}{dt} = (-3u_x\rho_x - 2u_{xx}\rho - \lambda\rho_x)(t, q(t, x)). \quad (134)$$

Taking $x = x_1(t)$ and noting $q(t, x_1(t)) = \xi(t)$, together with the definition of $m(t)$ in Lemma 15, one deduces $u_{xx}(t, \xi(t)) = 0$ a.e. $t \in [0, T]$. Thus

$$\frac{d\rho_x(t, \xi(t))}{dt} = [-3u_x(t, \xi(t)) - \lambda]\rho_x(t, \xi(t)). \quad (135)$$

Using the assumption $u_{0x}(x_0) = \inf_{x \in \mathbb{S}} u_{0x}(x)$ in Theorem 4, (57) and letting $\xi(0) = x_0$ yield $\rho_{0x}(\xi(0)) = \rho_{0x}(x_0)$. From (135), one deduces

$$\begin{aligned} \rho_x(t, \xi(t)) &= \rho_{0x}(x_0) e^{\int_0^t (-3u_x(s, \xi(s)) - \lambda) ds} \\ &= \rho_{0x}(x_0) e^{\int_0^t (-3\inf_{x \in \mathbb{S}} u_x(s, x) - \lambda) ds}. \end{aligned} \quad (136)$$

Thanks to (133), for all $t \in [0, T]$, we have

$$\begin{aligned} &e^{\int_0^t (-3\inf_{x \in \mathbb{S}} u_x(s, x) - \lambda) ds} \\ &\geq e^{\int_0^t [-3((u_{0x}(0) + \lambda_1/2)/(1 + s(1 - \delta)(u_{0x}(0) + \lambda_1/2)) - \lambda_1/2) - \lambda] ds} \quad (137) \\ &= e^{(3\lambda_1/2 - \lambda)t - (3/(1 - \delta)) \ln[1 + (1 - \delta)(u_{0x}(0) + \lambda_1/2)t]}. \end{aligned}$$

Note $e^{(3\lambda_1/2 - \lambda)t - (3/(1 - \delta)) \ln[1 + (1 - \delta)(u_{0x}(0) + \lambda_1/2)t]} \rightarrow \infty$ as $t \rightarrow -1/(1 - \delta)(u_{0x}(0) + \lambda_1/2)$. Thus, if $\rho_{0x}(x_0) > 0$, then from (136), for $T_1 \in (0, -1/(1 - \delta)(u_{0x}(0) + \lambda_1/2)]$, one has

$$\sup_{x \in \mathbb{S}} \rho_x(t, x) \geq \rho_x(t, \xi(t)) \rightarrow +\infty \quad \text{as } t \rightarrow T_1^-. \quad (138)$$

On the other hand, if $\rho_{0x}(x_0) < 0$, it follows from (136) that, for $T_1 \in (0, -1/(1 - \delta)(u_{0x}(0) + \lambda_1/2)]$, one deduces

$$\inf_{x \in \mathbb{S}} \rho_x(t, x) \leq \rho_x(t, \xi(t)) \rightarrow -\infty \quad \text{as } t \rightarrow T_1^-. \quad (139)$$

This completes the proof of Theorem 4.

4.4. The Proof of Theorem 5. Let $X(t, x) = (u(t, x), \rho(t, x))$ be the corresponding solution to system (1) with initial data (u_0, ρ_0) . Differentiating the first equation in (1) with respect to x , one has

$$\begin{aligned} u_{xt} &= -u_x^2 - uu_{xx} - g * \left(\frac{3}{2}u^2 + \frac{c}{2}\rho^2 \right) + \frac{3}{2}u^2 + \frac{c}{2}\rho^2 \\ &\quad - \lambda_1 u_x. \end{aligned} \quad (140)$$

Differentiating the second equation in system (6) with respect to x yields

$$\rho_{xt} = -u\rho_{xx} - 2u_{xx}\rho - (3u_x + \lambda)\rho_x. \quad (141)$$

We obtain that $-X(t, -x)$ is also a solution to system (1) provided that $X(t, x)$ is a solution to system (1). Note the

initial data u_0 and ρ_0 are odd; one derives $-X(0, -x) = X(0, x)$. Using the uniqueness of solutions yields $-X(t, -x) = X(t, x)$, and $X(t, x)$ is odd for all $t \in [0, T]$. Thus $u(t, 0) = u_{xx}(t, 0) = \rho(t, 0) = 0$ for all $t \in [0, T]$. From the above analysis and (140), we have

$$\frac{du_x(t, 0)}{dt} \leq -u_x^2(t, 0) - \lambda_1 u_x(t, 0). \quad (142)$$

Similar to the proof of Theorem 4, we complete the first part proof of Theorem 5. From (141), one deduces

$$\rho_{xt}(t, 0) = (-3u_x(t, 0) - \lambda)\rho_x(t, 0), \quad t \in [0, T]. \quad (143)$$

From (143), we get

$$\rho_x(t, 0) = \rho_{0x}(0) e^{\int_0^t (-3u_x(\tau, 0) - \lambda) d\tau}. \quad (144)$$

As before, we also obtain that $u_x(t, 0)$ is decreasing with $u_{0x}(0) < -\lambda_1$. Thus $-u_x(t, 0) > -u_{0x}(0) > 0$, which combined with (144) completes the proof of Theorem 5.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
