We present the $*$ congruence class of the least-square and the minimum norm least-square solutions to the system of complex matrix equation $AX = C$, $XB = D$ by generalized singular value decomposition and canonical correlation decomposition.

1. Introduction

Throughout we denote the complex $m \times n$ matrix space by $\mathbb{C}^{m \times n}$. The symbols I , A^* , and $\|A\|$ stand for the identity matrix with the appropriate size, the conjugate transpose, and the Frobenius norm of $A \in \mathbb{C}^{m \times n}$, respectively. Recall that matrices $X, Y \in \mathbb{C}^{n \times n}$ are in the same $*$ congruence class if there is a nonsingular $P \in \mathbb{C}^{n \times n}$ such that $X = P^*YP$ [1].

Investigating the classical system of matrix equations

$$AX = C, \quad XB = D \quad (1)$$

has attracted many people's attention and many results have been obtained about system (1) with various constraints, such as Hermitian, positive definite, positive semidefinite, reflexive, and generalized reflexive solutions (see [2–10]). Studying the least-square solutions of the system of matrix equations (1) is also a very active research topic (see [11–16]). It is well known that Hermitian, positive definite and positive semidefinite matrices are the special case of $*$ congruence. Therefore investigating the $*$ congruence class of a solution of the matrix equation (1) is very meaningful.

In 2005, Horn et al. [1] studied the possible $*$ congruence class of a square solution when linear matrix equation $AX = B$ is solvable. In 2009, Zheng et al. [17] describe $*$ congruence class of least-square and minimum norm least-square solutions of the equation $AX = B$ when it is not solvable and discuss a $*$ congruence class of the solutions of the system (1) when it is solvable. To our knowledge, so far

there has been little investigation of $*$ congruence class of the least-square and minimum norm least-square solutions to (1) when it is not solvable.

Motivated by the work mentioned above, we investigate the $*$ congruence class of the least-square and the minimum norm least-square solutions to the system of complex matrix equation (1) by generalized singular value decomposition (GSVD) and canonical correlation decomposition (CCD).

2. The $*$ Congruence Class of the Solutions to (1)

Lemma 1 (see [4]). Let $A \in \mathbb{C}^{m \times n}$ and $B \in \mathbb{C}^{n \times p}$. Then the GSVD of A and B^* can be expressed as

$$A = U\Sigma_AP, \quad B^* = V\Sigma_BP, \quad (2)$$

where $U \in \mathbb{C}^{m \times m}$ and $V \in \mathbb{C}^{p \times p}$ are unitary matrices, $P \in \mathbb{C}^{n \times n}$ is nonsingular matrix,

$$\Sigma_A \in \mathbb{C}^{m \times n}, \quad \Sigma_B \in \mathbb{C}^{p \times n}, \quad r = \text{rank} \begin{pmatrix} A \\ B^* \end{pmatrix},$$

$$\Sigma_A = \begin{pmatrix} I_A & & & \\ & S_A & & \\ & & O_A & \\ t & s & r-s-t & n-r \end{pmatrix},$$

$$\Sigma_B = \begin{pmatrix} O_B & S_B & \cdot & 0 \\ & & I_B & \cdot \\ t & s & r-s-t & n-r \end{pmatrix}, \quad (3)$$

I_A and I_B are identity matrices, O_A and O_B are zero matrices, and

$$S_A = \text{diag}(\alpha_1, \dots, \alpha_s), \quad S_B = \text{diag}(\beta_1, \dots, \beta_s) \quad (4)$$

with $1 > \alpha_1 \geq \dots \geq \alpha_s > 0$, $0 < \beta_1 \leq \dots \leq \beta_s < 1$, and $\alpha_i^2 + \beta_i^2 = 1$ ($i = 1, \dots, s$).

For convenience, in the following theorem we denote

$$PXP^* = \begin{pmatrix} X_{11} & X_{12} & X_{13} & X_{14} \\ X_{21} & X_{22} & X_{23} & X_{24} \\ X_{31} & X_{32} & X_{33} & X_{34} \\ X_{41} & X_{42} & X_{43} & X_{44} \\ t & s & r-s-t & n-r \end{pmatrix}, \quad (5)$$

$$U^*CP^* = \begin{pmatrix} C_{11} & C_{12} & C_{13} & C_{14} \\ C_{21} & C_{22} & C_{23} & C_{24} \\ C_{31} & C_{32} & C_{33} & C_{34} \\ t & s & r-s-t & n-r \end{pmatrix}, \quad (6)$$

$$PDV = \begin{pmatrix} D_{11} & D_{12} & D_{13} \\ D_{21} & D_{22} & D_{23} \\ D_{31} & D_{32} & D_{33} \\ D_{41} & D_{42} & D_{43} \\ p-r+t & s & r-s-t \end{pmatrix}.$$

Theorem 2. Let $A, C \in \mathbb{C}^{m \times n}$, $B, D \in \mathbb{C}^{n \times p}$, and the GSVD of A and B^* be expressed as (2), and then one has the following.

(a) The system of matrix equation (1) has a solution in $\mathbb{C}^{n \times n}$ if and only if

$$\begin{aligned} C_{3i} &= 0, & D_{i1} &= 0, & (i = 1, 2, 3, 4), \\ C_{12} &= D_{12}S_B^{-1}, & C_{13} &= D_{13}, \\ S_A^{-1}C_{22} &= D_{22}S_B^{-1}, & S_A^{-1}C_{23} &= D_{23}. \end{aligned} \quad (7)$$

(b) In that case, the general solutions of (1) are

$$X = P^{-1} \begin{pmatrix} C_{11} & C_{12} & C_{13} & C_{14} \\ S_A^{-1}C_{21} & S_A^{-1}C_{22} & D_{23} & S_A^{-1}C_{24} \\ X_{31} & D_{32}S_B^{-1} & D_{33} & X_{34} \\ X_{41} & D_{42}S_B^{-1} & D_{43} & X_{44} \end{pmatrix} (P^{-1})^*, \quad (8)$$

where X_{31} , X_{41} , X_{34} , and X_{44} are arbitrary.

(c) For arbitrary X_{31} , X_{41} , X_{34} , and X_{44} , there exists a solution in $\mathbb{C}^{n \times n}$ of (1) which is $*$ -congruent to

$$Y = \begin{pmatrix} C_{11} & C_{12} & C_{13} & C_{14} \\ S_A^{-1}C_{21} & S_A^{-1}C_{22} & D_{23} & S_A^{-1}C_{24} \\ X_{31} & D_{32}S_B^{-1} & D_{33} & X_{34} \\ X_{41} & D_{42}S_B^{-1} & D_{43} & X_{44} \end{pmatrix}. \quad (9)$$

(d) There exists a minimum norm solution in $\mathbb{C}^{n \times n}$ of (1) which is $*$ -congruent to

$$Y = \begin{pmatrix} C_{11} & C_{12} & C_{13} & C_{14} \\ S_A^{-1}C_{21} & S_A^{-1}C_{22} & D_{23} & S_A^{-1}C_{24} \\ 0 & D_{32}S_B^{-1} & D_{33} & 0 \\ 0 & D_{42}S_B^{-1} & D_{43} & 0 \end{pmatrix}. \quad (10)$$

Proof. Using the GSVD of A and B^* given by (2), we get

$$\begin{aligned} AX = C &\iff U\Sigma_APX = C \iff \Sigma_APXP^* = U^*CP^*, \\ XB = D &\iff XP^*\Sigma_B^*V^* = D \iff PXP^*\Sigma_B^* = PDV. \end{aligned} \quad (11)$$

By (2) and (5), Σ_APXP^* and $PXP^*\Sigma_B^*$ have the following matrix decomposition:

$$\begin{aligned} \Sigma_APXP^* &= \begin{pmatrix} X_{11} & X_{12} & X_{13} & X_{14} \\ S_AX_{21} & S_AX_{22} & S_AX_{23} & S_AX_{24} \\ 0 & 0 & 0 & 0 \end{pmatrix}, \\ PXP^*\Sigma_B^* &= \begin{pmatrix} 0 & X_{12}S_B & X_{13} \\ 0 & X_{22}S_B & X_{23} \\ 0 & X_{32}S_B & X_{33} \\ 0 & X_{42}S_B & X_{43} \end{pmatrix}, \end{aligned} \quad (12)$$

and we have that system (1) is equivalent to

$$\begin{aligned} \begin{pmatrix} X_{11} & X_{12} & X_{13} & X_{14} \\ S_AX_{21} & S_AX_{22} & S_AX_{23} & S_AX_{24} \\ 0 & 0 & 0 & 0 \end{pmatrix} &= \begin{pmatrix} C_{11} & C_{12} & C_{13} & C_{14} \\ C_{21} & C_{22} & C_{23} & C_{24} \\ C_{31} & C_{32} & C_{33} & C_{34} \end{pmatrix}, \\ \begin{pmatrix} 0 & X_{12}S_B & X_{13} \\ 0 & X_{22}S_B & X_{23} \\ 0 & X_{32}S_B & X_{33} \\ 0 & X_{42}S_B & X_{43} \end{pmatrix} &= \begin{pmatrix} D_{11} & D_{12} & D_{13} \\ D_{21} & D_{22} & D_{23} \\ D_{31} & D_{32} & D_{33} \\ D_{41} & D_{42} & D_{43} \end{pmatrix}; \end{aligned} \quad (13)$$

obviously, the system of matrix equation (1) has a solution in $\mathbb{C}^{n \times n}$ if and only if

$$\begin{aligned} C_{3i} &= 0, & D_{i1} &= 0, & S_AX_{2i} &= C_{2i}, \\ X_{i2}S_B &= D_{i2}, & X_{i1} &= C_{i1}, & X_{i3} &= D_{i3}, \\ & & & & (i = 1, 2, 3, 4). \end{aligned} \quad (14)$$

Therefore, (1) has a solution in $\mathbb{C}^{n \times n}$ if and only if (7) holds, and a general form of the solutions can be expressed as (8); for arbitrary X_{31} , X_{41} , X_{34} , and X_{44} , there exists a solution in $\mathbb{C}^{n \times n}$ of (1) which is $*$ -congruent to (9), and the part (d) follows from the definition of Frobenius norm. $\square$

Remark 3. In 2009, Zheng et al. [17] discuss a $*$ -congruence class of the solutions of the system (1) when it is solvable. Our result in Theorem 2 is different with the result mentioned above.

3. The *Congruence Class of the Least-Square Solutions to (1)

Lemma 4 (see [18]). Let the CCD of matrix pair $[A, C]$ with $A \in \mathbb{C}^{m \times n}$, $C \in \mathbb{C}^{m \times k}$, $\text{rank } A = g$, and $\text{rank } C = h$ be given as

$$A = U(\Sigma_A, 0)E_A^{-1}, \quad C = U(\Sigma_C, 0)E_C^{-1}, \quad (15)$$

where U is a unitary matrix and

$$\Sigma_A = \begin{pmatrix} I_i & & \\ & \Lambda_j & \\ \bar{0} & - & 0 \\ & \Delta_j & \\ & & I_t \end{pmatrix}, \quad \Sigma_C = \begin{pmatrix} I_h \\ & \bar{0} \end{pmatrix} \quad (16)$$

are nonsingular matrices with the same row partitioning, and $g = i + j + t$,

$$\Lambda_j = \text{diag}(\lambda_{i+1}, \dots, \lambda_{i+j}), \quad 1 > \lambda_{i+1} \geq \dots \geq \lambda_{i+j} > 0,$$

$$\Delta_j = \text{diag}(\Delta_{i+1}, \dots, \Delta_{i+j}), \quad 0 > \Delta_{i+1} \geq \dots \geq \Delta_{i+j} > -1,$$

$$\Lambda_j^2 + \Delta_j^2 = I_j,$$

$$U = \begin{pmatrix} u_1 & u_2 & u_3 & u_4 & u_5 & u_6 \\ i & j & h-i-j & m-h-j-t & j & t \end{pmatrix}. \quad (17)$$

Lemma 5 (see [18]). Given $E, F \in \mathbb{C}^{m \times n}$, then there exists a unique matrix $\bar{S} \in \mathbb{C}^{m \times n}$ such that

$$\|S - E\|^2 + \|S - F\|^2 = \min, \quad (18)$$

and $\bar{S}$ can be expressed as

$$\bar{S} = E + F. \quad (19)$$

Lemma 6 (see [10]). Given $E, F \in \mathbb{C}^{m \times n}$, $\Omega_1 = \text{diag}(a_1, \dots, a_m)$, $\Omega_2 = \text{diag}(b_1, \dots, b_n)$, $a_i > 0$ ($i = 1, \dots, m$), and $b_j > 0$ ($j = 1, \dots, n$), then there exists a unique matrix $\bar{S} \in \mathbb{C}^{m \times n}$ such that

$$\|\Omega_1 S - E\|^2 + \|\Omega_2 S - F\|^2 = \min, \quad (20)$$

and $\bar{S}$ can be expressed as

$$\bar{S} = \Phi * (\Omega_1 E + F \Omega_2), \quad (21)$$

where

$$\Phi = \left(\frac{1}{a_i^2 + b_j^2} \right) \in \mathbb{C}^{m \times n}. \quad (22)$$

Using Lemmas 5 and 6, we can easily obtain the following.

Lemma 7. Given $E, F, G \in \mathbb{C}^{m \times n}$, $\Omega_1 = \text{diag}(a_1, \dots, a_m)$, $\Omega_2 = \text{diag}(b_1, \dots, b_m)$, $I_n = \text{diag}(i_1, \dots, i_n)$, $a_i > 0$ ($i = 1, \dots, m$), $b_j > 0$ ($j = 1, \dots, m$), and $i_k = 1$ ($k = 1, \dots, n$), then there exist unique matrices S and W such that

$$\|\Omega_1 S + \Omega_2 W - E\|^2 + \|S - F\|^2 + \|W - G\|^2 = \min, \quad (23)$$

and S and W can be expressed as

$$S = F, \quad W = \Phi * (\Omega_2 (\Omega_1 F - E) + G), \quad (24)$$

where

$$\Phi = \left(\frac{1}{b_j^2 + i_k^2} \right) \in \mathbb{C}^{m \times n}. \quad (25)$$

Lemma 8. Given $E, F \in \mathbb{C}^{m \times n}$, $\Omega_1 = \text{diag}(a_1, \dots, a_m)$, $\Omega_2 = \text{diag}(b_1, \dots, b_n)$, $a_i > 0$ ($i = 1, \dots, m$), and $b_j > 0$ ($j = 1, \dots, n$), then there exist unique matrices S and W such that

$$\|\Omega_1 S + \Omega_2 W - E\|^2 = \min, \quad (26)$$

and S and W can be expressed as

$$S = 0, \quad W = \Omega_2^{-1} E. \quad (27)$$

Let $A, C \in \mathbb{C}^{m \times n}$, $B, D \in \mathbb{C}^{n \times l}$, and $\text{rank } A = p \geq \text{rank } B = q$. According to Lemma 4, there exist a unitary matrix $U \in \mathbb{C}^{n \times n}$ and nonsingular matrices $R_A \in \mathbb{C}^{m \times m}$ and $R_B \in \mathbb{C}^{l \times l}$, such that the CCD of matrix pair $[A^*, B]$ is given as

$$A^* = U(\Sigma_A, 0)R_A^{-1}, \quad B = U(\Sigma_B, 0)R_B^{-1}, \quad (28)$$

where $\Sigma_A \in \mathbb{C}^{n \times p}$, $\Sigma_B \in \mathbb{C}^{n \times q}$,

$$\Sigma_A = \begin{pmatrix} I_r & 0 & 0 \\ 0 & G_s & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & S_s & 0 \\ 0 & 0 & I_t \end{pmatrix}, \quad \Sigma_B = \begin{pmatrix} I_r & 0 & 0 \\ 0 & I_s & 0 \\ 0 & 0 & I_{q-r-s} \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad (29)$$

where $p = r + s + t$,

$$G_s = \text{diag}(g_{r+1}, \dots, g_{r+s}), \quad 1 > g_{r+1} \geq \dots \geq g_{r+s} > 0,$$

$$S_s = \text{diag}(w_{r+1}, \dots, w_{r+s}), \quad 0 > w_{r+1} \geq \dots \geq w_{r+s} > -1,$$

$$G_s^2 + S_s^2 = I_s,$$

$$U = \begin{pmatrix} u_1 & u_2 & u_3 & u_4 & u_5 & u_6 \\ r & s & q-r-s & n-q-s-t & s & t \end{pmatrix}. \quad (30)$$

Without loss of generality, let $p = q$, and then we have the following results.

Theorem 9. Let $A, C \in \mathbb{C}^{m \times n}$, $B, D \in \mathbb{C}^{n \times l}$, and the CCD of matrix pair $[A^*, B]$ be expressed as (28), and then one has the following.

(a) The least-square solutions to the system (1) are

$$X = U \begin{pmatrix} C_{11} + D_{11} & C_{12} + D_{12} & C_{13} + D_{13} & C_{14} & C_{15} & C_{16} \\ D_{21} & D_{22} & D_{23} & 0 & 0 & 0 \\ D_{31} & D_{32} & D_{33} & X_{34} & X_{35} & X_{36} \\ D_{41} & D_{42} & D_{43} & X_{44} & X_{45} & X_{46} \\ Y_{51} & Y_{52} & Y_{53} & S^{-1}C_{24} & S^{-1}C_{25} & S^{-1}C_{26} \\ D_{31} + D_{61} & D_{32} + D_{62} & D_{33} + D_{63} & C_{34} & C_{35} & C_{36} \end{pmatrix} U^*, \quad (31)$$

where $X_{34}, X_{35}, X_{36}, X_{44}, X_{45},$ and X_{46} are arbitrary, $Y_{5i} = \Phi * (S(GD_{2i} - C_{2i}) + D_{5i}), i = 1, 2, 3, \Phi = (1/(w_{r+j}^2 + e_k^2)) \in \mathbb{C}^{s \times s},$ and $e_k = 1, j = 1, \dots, s, k = 1, \dots, s.$

(b) For arbitrary $X_{34}, X_{35}, X_{36}, X_{44}, X_{45},$ and $X_{46},$ there exists a least-square solution in $\mathbb{C}^{n \times n}$ of (1) which is * congruent to

$$Y = \begin{pmatrix} C_{11} + D_{11} & C_{12} + D_{12} & C_{13} + D_{13} & C_{14} & C_{15} & C_{16} \\ D_{21} & D_{22} & D_{23} & 0 & 0 & 0 \\ D_{31} & D_{32} & D_{33} & X_{34} & X_{35} & X_{36} \\ D_{41} & D_{42} & D_{43} & X_{44} & X_{45} & X_{46} \\ Y_{51} & Y_{52} & Y_{53} & S^{-1}C_{24} & S^{-1}C_{25} & S^{-1}C_{26} \\ D_{31} + D_{61} & D_{32} + D_{62} & D_{33} + D_{63} & C_{34} & C_{35} & C_{36} \end{pmatrix}, \quad (32)$$

where $Y_{5i} = \Phi * (S(GD_{2i} - C_{2i}) + D_{5i}), i = 1, 2, 3, \Phi = (1/(w_{r+j}^2 + e_k^2)) \in \mathbb{C}^{s \times s},$ and $e_k = 1, j = 1, \dots, s, k = 1, \dots, s.$

(c) There exists a minimum norm least-square solution in $\mathbb{C}^{n \times n}$ of (1) which is * congruent to

$$Y = \begin{pmatrix} C_{11} + D_{11} & C_{12} + D_{12} & C_{13} + D_{13} & C_{14} & C_{15} & C_{16} \\ D_{21} & D_{22} & D_{23} & 0 & 0 & 0 \\ D_{31} & D_{32} & D_{33} & 0 & 0 & 0 \\ D_{41} & D_{42} & D_{43} & 0 & 0 & 0 \\ Y_{51} & Y_{52} & Y_{53} & S^{-1}C_{24} & S^{-1}C_{25} & S^{-1}C_{26} \\ D_{31} + D_{61} & D_{32} + D_{62} & D_{33} + D_{63} & C_{34} & C_{35} & C_{36} \end{pmatrix}, \quad (33)$$

where $Y_{5i} = \Phi * (S(GD_{2i} - C_{2i}) + D_{5i}), i = 1, 2, 3, \Phi = (1/(w_{r+j}^2 + e_k^2)) \in \mathbb{C}^{s \times s},$ and $e_k = 1, j = 1, \dots, s, k = 1, \dots, s.$

Then,

Proof. It follows from (28) that

$$\begin{aligned} AX = C &\iff (R_A^{-1})^* \begin{pmatrix} \Sigma_A^* \\ 0 \end{pmatrix} U^* X = C \\ &\iff \begin{pmatrix} \Sigma_A^* \\ 0 \end{pmatrix} U^* X = (R_A)^* C, \end{aligned}$$

$$XB = D \iff XU(\Sigma_B, 0)R_B^{-1} = D \iff XU(\Sigma_B, 0) = DR_B. \quad (34)$$

$$\begin{aligned} &\|AX - C\|^2 + \|XB - D\|^2 \\ &= \left\| \begin{pmatrix} \Sigma_A^* \\ 0 \end{pmatrix} U^* X - (R_A)^* C \right\|^2 + \|XU(\Sigma_B, 0) - DR_B\|^2 \\ &= \left\| \begin{pmatrix} \Sigma_A^* \\ 0 \end{pmatrix} U^* XU - (R_A)^* CU \right\|^2 \\ &\quad + \|U^* XU(\Sigma_B, 0) - U^* DR_B\|^2. \end{aligned} \quad (35)$$

Assume that

$$U^* XU = \begin{pmatrix} X_{11} & X_{12} & X_{13} & X_{14} & X_{15} & X_{16} \\ X_{21} & X_{22} & X_{23} & X_{24} & X_{25} & X_{26} \\ X_{31} & X_{32} & X_{33} & X_{34} & X_{35} & X_{36} \\ X_{41} & X_{42} & X_{43} & X_{44} & X_{45} & X_{46} \\ X_{51} & X_{52} & X_{53} & X_{54} & X_{55} & X_{56} \\ X_{61} & X_{62} & X_{63} & X_{64} & X_{65} & X_{66} \end{pmatrix}, \quad (36)$$

$$(R_A)^* CU = \begin{pmatrix} C_{11} & C_{12} & C_{13} & C_{14} & C_{15} & C_{16} \\ C_{21} & C_{22} & C_{23} & C_{24} & C_{25} & C_{26} \\ C_{31} & C_{32} & C_{33} & C_{34} & C_{35} & C_{36} \\ C_{41} & C_{42} & C_{43} & C_{44} & C_{45} & C_{46} \end{pmatrix}, \quad (37)$$

$$U^* DR_B = \begin{pmatrix} D_{11} & D_{12} & D_{13} & D_{14} \\ D_{21} & D_{22} & D_{23} & D_{24} \\ D_{31} & D_{32} & D_{33} & D_{34} \\ D_{41} & D_{42} & D_{43} & D_{44} \\ D_{51} & D_{52} & D_{53} & D_{54} \\ D_{61} & D_{62} & D_{63} & D_{64} \end{pmatrix},$$

and then

$$\begin{aligned} & \left\| \begin{pmatrix} \Sigma_A^* \\ 0 \end{pmatrix} U^* XU - (R_A)^* CU \right\|^2 + \|U^* XU(\Sigma_B, 0) - U^* DR_B\|^2 \\ &= \left\| \begin{pmatrix} X_{11} & X_{12} & \cdots & X_{16} \\ GX_{21} + SX_{51} & GX_{22} + SX_{52} & \cdots & GX_{26} + SX_{56} \\ X_{61} & X_{62} & \cdots & X_{66} \\ 0 & 0 & \cdots & 0 \end{pmatrix} \right. \\ &\quad \left. - \begin{pmatrix} C_{11} & C_{12} & \cdots & C_{16} \\ C_{21} & C_{22} & \cdots & C_{26} \\ C_{31} & C_{32} & \cdots & C_{36} \\ C_{41} & C_{42} & \cdots & C_{46} \end{pmatrix} \right\|^2 \\ &\quad + \left\| \begin{pmatrix} X_{11} & X_{12} & X_{13} & 0 \\ X_{21} & X_{22} & X_{23} & 0 \\ \vdots & \vdots & \vdots & \vdots \\ X_{61} & X_{62} & X_{63} & 0 \end{pmatrix} \right. \\ &\quad \left. - \begin{pmatrix} D_{11} & D_{12} & D_{13} & D_{14} \\ D_{21} & D_{22} & D_{23} & D_{24} \\ \vdots & \vdots & \vdots & \vdots \\ D_{61} & D_{62} & D_{63} & D_{64} \end{pmatrix} \right\|^2 \\ &= \|X_{11} - C_{11}\|^2 + \|X_{11} - D_{11}\|^2 + \|X_{12} - C_{12}\|^2 \\ &\quad + \|X_{12} - D_{12}\|^2 + \|X_{13} - C_{13}\|^2 + \|X_{13} - D_{13}\|^2 \\ &\quad + \|X_{61} - C_{31}\|^2 + \|X_{61} - D_{61}\|^2 + \|X_{62} - C_{32}\|^2 \\ &\quad + \|X_{62} - D_{62}\|^2 + \|X_{63} - C_{33}\|^2 + \|X_{63} - D_{63}\|^2 \end{aligned}$$

$$\begin{aligned} & + \|GX_{21} + SX_{51} - C_{21}\|^2 + \|X_{21} - D_{21}\|^2 \\ & + \|X_{51} - D_{51}\|^2 + \|GX_{22} + SX_{52} - C_{22}\|^2 \\ & + \|X_{22} - D_{22}\|^2 + \|X_{52} - D_{52}\|^2 \\ & + \|GX_{23} + SX_{53} - C_{23}\|^2 + \|X_{23} - D_{23}\|^2 \\ & + \|X_{53} - D_{53}\|^2 + \|GX_{24} + SX_{54} - C_{24}\|^2 \\ & + \|GX_{25} + SX_{55} - C_{25}\|^2 + \|GX_{26} + SX_{56} - C_{26}\|^2 \\ & + \|X_{14} - C_{14}\|^2 + \|X_{15} - C_{15}\|^2 + \|X_{16} - C_{16}\|^2 \\ & + \|X_{64} - C_{34}\|^2 + \|X_{65} - C_{35}\|^2 + \|X_{66} - C_{36}\|^2 \\ & + \|X_{31} - D_{31}\|^2 + \|X_{32} - D_{32}\|^2 + \|X_{33} - D_{33}\|^2 \\ & + \|X_{41} - D_{41}\|^2 + \|X_{42} - D_{42}\|^2 + \|X_{43} - D_{43}\|^2. \end{aligned} \quad (38)$$

By Lemmas 5, 7, and 8, a general form of the least-square solutions can be expressed as (31); for arbitrary $X_{34}, X_{35}, X_{36}, X_{44}, X_{45},$ and X_{46} , there exists a least-square solution in $\mathbb{C}^{n \times n}$ of (1) which is $*$ -congruent to (32), and the part (c) follows from the definition of Frobenius norm. $\square$

4. An Algorithm and Numerical Examples

Based on the main results of this paper, we in this section propose an algorithm for finding the least-square solutions to the system (1). All the tests are performed by MATLAB 6.5 which has a machine precision of around 10^{-16} .

Algorithm 1. (1) Input $A \in \mathbb{C}^{m \times n}$ and $B \in \mathbb{C}^{n \times l}$, and compute $U \in \mathbb{C}^{n \times n}$, $R_A^{-1} \in \mathbb{C}^{m \times m}$, $R_B^{-1} \in \mathbb{C}^{l \times l}$, $\Sigma_A, \Sigma_B \in \mathbb{C}^{n \times p}$, and $G, S \in \mathbb{C}^{s \times s}$ by the CCD of matrix pair $[A^*, B]$.

(2) Input $C \in \mathbb{C}^{m \times n}$, $D \in \mathbb{C}^{n \times l}$, and compute C_{ij} ($i = 1, 2, 3, 4; j = 1, 2, 3, 4, 5, 6$) and D_{lk} ($l = 1, 2, 3, 4, 5, 6; k = 1, 2, 3, 4$) according to (37).

(3) Compute the least-square solutions of the system (1) by (31).

(4) Compute the $*$ -congruence class of the least-square and the minimum norm least-square solutions to the system (1) according to (32) and (33).

Example 1. Suppose

$$A = \begin{bmatrix} -1.625 & 0 & -0.6875i & 0.875i & 0.3438 & 0 \\ -2 & 0 & -0.5i & 0.875i & 0.25 & 0 \\ -0.75 & 0 & -0.125i & 0.25i & 0.0625 & 0 \\ 2.625 & 0 & 0.6875i & -0.875i & -0.3438 & 0 \end{bmatrix},$$

$$B = \begin{bmatrix} 2 & -2 & 0 & -1 \\ -5i & 6i & 0 & 2i \\ 31i & -37i & i & -15i \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix},$$

$$C = \begin{bmatrix} 3 & 2 & 2 & 1 & 1 & 5 \\ 4 & i & i & -i & 3 & 1 \\ 5 & 6 & 7 & 4 & 3 & 1 \\ 2 & 1 & 1 & 4 & 3 & 4 \end{bmatrix},$$

$$D = \begin{bmatrix} i & -i & -i & 1 \\ 2 & 3 & 1 & 4 \\ 4 & 1 & 2 & 3 \\ 5 & 7 & 6 & 9 \\ 9 & 7 & 5 & 6 \\ 1 & 2 & 3 & 2 \end{bmatrix}.$$

$$R_A^{-1} = \begin{bmatrix} -1.625 & -2 & -0.75 & 2.625 \\ 1.375 & 1 & 0.25 & -1.375 \\ -0.875 & 0 & -0.25 & 0.875 \\ 0.375 & 0 & 0.25 & -0.375 \end{bmatrix},$$

$$R_B^{-1} = \begin{bmatrix} 2 & -2 & 0 & -1 \\ 31 & -37 & 1 & -15 \\ 5 & -6 & 0 & -2 \\ -44 & 52 & -1 & 21 \end{bmatrix},$$

$$G = [0.5], \quad S = [0.25],$$

(39)

Applying Algorithm 1, we obtain the following:

$$U = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & -i & 0 & 0 & 0 \\ 0 & i & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & i \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -i & 0 & 0 \end{bmatrix},$$

$$\Sigma_A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0.5 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0.25 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \quad \Sigma_B = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix},$$

$$(R_A)^*CU = \begin{pmatrix} 5 & 3i & -3i & -9i & 4 & 5i \\ 14 & -1+6i & 1-6i & -19i & 11 & 1+10i \\ 32 & -2+26i & 2-23i & -22i & 25 & 2+25i \\ 53 & -1+57i & 1-50i & -34i & 38 & 1+46i \end{pmatrix},$$

$$U^*DR_B = \begin{pmatrix} 0.03-0.05i & 0.02-0.05i & 0.04-0.02i & 0.02-0.04i \\ -0.51i & -0.27i & -0.33i & -0.25i \\ 0.43i & 0.21i & 0.29i & 0.2i \\ 0.41i & 0.26i & 0.25i & 0.23i \\ 1.35 & 0.67 & 0.78 & 0.62 \\ -1.27i & -0.71i & -0.82i & -0.65i \end{pmatrix}.$$

(40)

The least-square solutions to the system (1) are

$$X = U \begin{pmatrix} 5.03-0.05i & 0.02+2.95i & 0.04-3.02i & -9i & 4 & 5i \\ -0.51i & -0.27i & -0.33i & 0 & 0 & 0 \\ 0.43i & 0.21i & 0.29i & X_{34} & X_{35} & X_{36} \\ 0.41i & 0.26i & 0.25i & X_{44} & X_{45} & X_{46} \\ 2.02-0.06i & 0.864-0.366i & 0.498+1.448i & 76i & 44 & 4+40i \\ -0.84i & -0.5i & -0.53i & -22i & 25 & 2+25i \end{pmatrix} U^*,$$

(41)

where X_{34} , X_{35} , X_{36} , X_{44} , X_{45} , and X_{46} are arbitrary.

For arbitrary X_{34} , X_{35} , X_{36} , X_{44} , X_{45} , and X_{46} , there exists a least-square solution in $\mathbb{C}^{6 \times 6}$ of (1) which is $*$ -congruent to

$$Y = \begin{pmatrix} 5.03-0.05i & 0.02+2.95i & 0.04-3.02i & -9i & 4 & 5i \\ -0.51i & -0.27i & -0.33i & 0 & 0 & 0 \\ 0.43i & 0.21i & 0.29i & X_{34} & X_{35} & X_{36} \\ 0.41i & 0.26i & 0.25i & X_{44} & X_{45} & X_{46} \\ 2.02-0.06i & 0.864-0.366i & 0.498+1.448i & 76i & 44 & 4+40i \\ -0.84i & -0.5i & -0.53i & -22i & 25 & 2+25i \end{pmatrix}.$$

(42)

There exists a minimum norm least-square solution in $\mathbb{C}^{6 \times 6}$ of (1) which is $*$ -congruent to

$$Y = \begin{pmatrix} 5.03-0.05i & 0.02+2.95i & 0.04-3.02i & -9i & 4 & 5i \\ -0.51i & -0.27i & -0.33i & 0 & 0 & 0 \\ 0.43i & 0.21i & 0.29i & 0 & 0 & 0 \\ 0.41i & 0.26i & 0.25i & 0 & 0 & 0 \\ 2.02-0.06i & 0.864-0.366i & 0.498+1.448i & 76i & 44 & 4+40i \\ -0.84i & -0.5i & -0.53i & -22i & 25 & 2+25i \end{pmatrix}.$$
