The nonlinear tumor equation in spherical coordinates assuming that both the diffusivity and the killing rate are functions of the concentration of tumor cells is studied. A complete classification with regard to the diffusivity and net killing rate is obtained using Lie symmetry analysis. The reduction of the nonlinear governing equation is carried out in some interesting cases and exact solutions are obtained.

1. Introduction

The tumor growth has been usually modeled as a reaction-diffusion process in the literature. Jones et al. [1] have given a simple tumor model based upon this idea. A model describing the growth of the tumor in brain taking into account diffusion or motility as well as proliferation of tumor cells has been developed in a series of papers [2, 3]. In continuation of this approach, Tracqui et al. [4] suggest a model which takes into account treatment and thus killing rate of tumor cells along with the above factors. The governing equation in this case is

\[ u_t = D \nabla^2 u + Pu - ku, \]  

(1)

where \( u \) is the concentration of tumor cells, \( D \) is the diffusion coefficient, \( P \) is the proliferation rate, and \( k \) is the killing rate. Assuming complete radial symmetry, Moyo and Leach [3] have studied this model with \( K(x, t) = P - k \) being variable. The resulting governing equation reduces to the simple form

\[ u_t = u_{xx} - Ku, \]  

(2)

where \( u(x, t) = ru(r, t) \). They have performed Lie symmetry analysis and presented some exact solutions based upon this approach. Consequently, Bokhari et al. [5] used Lie symmetry analysis to obtain a number of invariant reductions and exact solutions in the case of killing rate \( K(u) \) being function of \( u \). The present study is based upon the fact that the diffusivity is not necessarily a constant and may depend upon the concentration of tumor cells. Moreover, the net killing rate \( K \) is also taken to be \( u \)-dependent. This introduces nonlinearity in the governing equation. Keeping these assumptions in mind (1) becomes

\[ u_t = \nabla \cdot (D(u) \nabla u) - K(u)u, \]  

(3)

which in spherical coordinates and with radial symmetry assumption becomes

\[ \frac{1}{x^2} \frac{\partial}{\partial x} \left( x^2 D(u) u_x \right) - K(u) u = u_t, \]  

(4)

where \( D(u) \) is the diffusivity of the medium and \( K(u) \) is the net killing rate. We present a classification of the functions \( D(u) \) and \( K(u) \) using Lie symmetry analysis. The Lie symmetry approach, first proposed by Lie [6], has been used to classify nonlinear differential equations, find appropriate similarity transformations, and find exact solutions. One may refer to [7–10] for a good account of this method. Some recent studies in nonlinear diffusion equations using this approach can be found in [1, 6].

2. Symmetry Analysis of the Tumor Equation

In this section, we perform the symmetry analysis of (4). To this end, we use the Lie symmetry method [10] which is based upon finding Lie point symmetries of the PDEs that leave them invariant. In order to find the Lie symmetry generators of (4) and obtain closed-form solutions for all \( K(u) \), we...
consider the one-parameter Lie point transformation that leaves (4) invariant. These transformation formulae [7, 9] are given as follows:

\[ \xi^i = x^i + \epsilon x^i \left( f^i \right) + O \left( \epsilon^2 \right), \quad i = 1, \ldots, 4, \tag{5} \]

where \( \xi^i = \left( \partial f^i / \partial \epsilon \right) \) defines the symmetry generator [9] associated with (2) given by

\[ V = \xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y} + \tau \frac{\partial}{\partial t} + \phi \frac{\partial}{\partial u}. \tag{6} \]

Requiring invariance of (4) with respect to the prolonged symmetry generator,

\[ V^{(2)} = V + \sum_{i=0}^{2} \phi^i \frac{\partial}{\partial u_i} + \sum_{i,j=0}^{3} \phi^{ij} \frac{\partial}{\partial u_{ij}}, \quad I, J = 0, 1, \tag{7} \]

with 0 representing \( t \) and 1 representing \( x \),

\[ \xi \left( D(u)u_{xx} + D_uu_x^2 - k(u)u - u_k \right) + \phi \left( xD_u u_{xx} + x^2 D_{uu} u_x + 2D_u u_x - xk(u) - xu_k \right) + \phi^2 \left( 2x D_u u_x + 2D(u) \right) - xJ + xD(u) \phi = 0, \tag{8} \]

and the coefficients \( \phi^i \) and \( \phi^{ik} \) of the derivatives with respect to dependent variables in (8) are to be evaluated using the expressions:

\[ \phi^i = D_i \left( \phi - \xi^i u_{ji} \right) + \xi^j u_{ji}, \tag{9} \]

\[ \phi^{ik} = D_i D_j \left( \phi - \xi^j u_{ji} \right) + \xi^k u_{kj}. \]

Using (9) into (8) and comparing terms involving derivatives of the dependent variable \( u \), we obtain the following system of differential equations:

\[ \xi_u = 0 = \tau_x = \tau_u = \phi_{uu}, \tag{10} \]

\[ D_t \phi - 2D_x \xi + Dr_t = 0, \tag{11} \]

\[ -xK\phi - xuK_u\phi + 2Dx\phi_x - x\phi_x + xuK\phi_u, \tag{12} \]

\[ -xuKr_t + xD_x\phi_u = 0, \tag{13} \]

\[ -2D\xi + 2xD_t\phi - 2Dx\xi_x - 2Dx r_t + x^2 \xi_t \]

\[ + 2Dx^2\phi_{xx} - Dx^2 \xi_{xx} = 0. \tag{14} \]

To determine the unknown functions \( \xi, \tau \), and \( \phi \), we solve the above coupled system of differential equations by first considering (11). Differentiating this equation twice with respect to \( u \) leads to the following expression:

\[ \phi_{uu} = \left( \frac{D}{D_u} \right) \left( 2\xi_x - \tau_t \right). \tag{14} \]

Using (10) into (14) reduces to

\[ \left( \frac{D}{D_u} \right) \left( 2\xi_x - \tau_t \right) = 0. \tag{15} \]

We proceed from the above equation to obtain a complete classification of both \( D \) and \( K \) as shown in the next section.

### 3. Classification

In order to perform a complete classification of solution of (4), we notice that the following three cases arise from (15):

1. \( 2\xi_x - \tau_t = 0 \),
2. \( (D/D_u)\xi_{uu} = 0 \),
3. \( 2\xi_x - \tau_t = 0 = (D/D_u)\xi_{uu} \).

For obtaining a complete classification, we consider all the three cases one by one. Since procedure of classification in all the three cases is similar, we present a complete analysis in the first case and briefly state the results in the remaining cases. To begin the classification, we proceed as follows.

#### 3.1. Case I \((2\xi_x - \tau_t = 0)\)

In this case the system of determining equations given by (10)–(13) becomes

\[ \xi_u = 0 = \tau_x = \tau_u = \phi_t, \tag{16} \]

\[ 2\xi_x = \tau_t, \tag{17} \]

\[ -xuKr_t = 0, \tag{18} \]

\[ -2D\xi + xD_t r_t + x^2 \xi_t = 0. \tag{19} \]

From (18), three subcases arise:

- (a) \( \tau_t = 0 \),
- (b) \( K(u) = 0 \),
- (c) \( \tau_t = 0 = K(u) \).

We first consider (a).

#### 3.1.1. Subcase \( a \) \((\tau_t = 0)\)

Using these conditions arising in this case, we deduce that

\[ \xi_x = 0 \implies \xi = \xi(t), \tag{20} \]

and (19) becomes

\[ -2D\xi + x^2 \xi_t = 0. \tag{21} \]

Note that (21) is a separable DE and can be easily solved to find \( \xi \) given by \( \xi = c_1 \exp(-2Dx^{-2} t^2) \).

But \( \xi \) depend only on \( t \), so that two possibilities arise from expression of \( \xi \):

- (a.1) \( c_2 = 0 \) and \( D \neq 0 \),
- (a.2) \( D = 0 \) and \( c_2 \neq 0 \).

Subsubcase \( a.1 \). This subcase leads to the fact that \( D(u) \) and \( K(u) \) are arbitrary and the infinitesimals are

\[ \xi = 0, \quad \tau = c_1, \quad \phi = 0. \tag{22} \]

Only one symmetry generator is associated with above infinitesimals which is \( X = (\partial/\partial t) \).

Subsubcase \( a.2 \). As a result of this subcase, \( D(u) = 0 \) and \( K(u) \) are arbitrary and the infinitesimals are

\[ \xi = c_2, \quad \tau = c_1, \quad \phi = 0. \tag{23} \]
Table 1: Commutator table of the tumor equation.

<table>
<thead>
<tr>
<th>[X₁, X₂]</th>
<th>X₁</th>
<th>X₂</th>
</tr>
</thead>
<tbody>
<tr>
<td>X₁</td>
<td>0</td>
<td>−2X₂</td>
</tr>
<tr>
<td>X₂</td>
<td>2X₂</td>
<td>0</td>
</tr>
</tbody>
</table>

In this subcase, we have two generators which are

\[ X₁ = \frac{\partial}{\partial x}, \quad X₂ = \frac{\partial}{\partial t}. \]  (24)

3.1.2. Subcase (b) \((K(u) = 0)\). Using these conditions arising in this case into (13), it becomes

\[ -2D\xi + 2xD\xi_x + x^2\xi + 3Dx^2\xi_{xx} = 0. \]  (25)

Differentiating (25) with respect to \(u\), we get

\[ 3x^2\xi_{xx} + 2x\xi_x - 2\xi = 0. \]  (26)

The above equation is a Cauchy Euler differential equation, its solution given by

\[ \xi = A(t)x + B(t)x^{-(2/3)}. \]  (27)

To require consistency of \(\xi\) found above, we use (27) into (25). This suggests that (25) is satisfied when the following differential constraint is met:

\[ A_1x^3 + B_1x^{4/3} = 0. \]  (28)

Differentiating (28) four times with respect to \(x\), we get

\[ \xi = c_1x + c_2x^{-(2/3)}. \]  (29)

Using (29) into (17), we conclude that

\[ \tau = 2c_1t - \frac{4}{3}c_2x^{-(5/3)} + c_3. \]  (30)

From (16) and (30), we infer that \(c_2 = 0\) and consequently the general expressions of \(\xi\), \(\tau\), \(\phi\), \(D\), and \(K\) are

\[ \xi = c_1x, \quad \tau = 2c_1t + c_3, \quad \phi = 0, \quad K(u) = 0, \quad D(u) \text{ is arbitrary.} \]  (31)

The two symmetry generators associated with above infinitesimals are given by

\[ X₁ = x\frac{\partial}{\partial x} + 2t\frac{\partial}{\partial t}, \quad X₂ = \frac{\partial}{\partial t}. \]  (32)

The commutation relation for each of the above symmetry generators is listed in Table 1.

3.1.3. Subcase (c) \((\tau_ι = 0 = K(u))\). Following the procedure adopted in earlier cases, we obtain the same symmetry generators in cases (a) and (b).

3.2. Case II \((D/D_u)_\text{int} = 0\). Solving equation \((D/D_u)_\text{int} = 0\) for \(D(u)\) instantly yields

\[ D(u) = (bu)^{1/b}, \]  (33)

where \(b\) is a constant. Using (33) into (11), we obtain

\[ \phi = (bu)(2\xi_x - \tau_ι). \]  (34)

Using (34) and (33) into (13), we obtain a differential relation in \(\xi\) given by

\[ -2(bu)^{1/b}\xi + 2x(bu)^{1/b}\xi_x + x^2\xi_t = 0. \]  (35)

Differentiating (35) with respect to \(u\), we obtain

\[ -2\xi + 2x\xi_x + x^2(4b - 1)\xi_{xx} = 0. \]  (36)

From (36) two cases arise:

(a) \(b \neq 1/4\),

(b) \(b = 1/4\).

3.2.1. Subcase (a) \((b \neq 1/4)\). This subcase gives that

\[ \xi = A(t)x + B(t)x^{-2/m_1}, \quad \text{where } m_1 = 4b - 1. \]  (37)

Using (37) into (35) yields

\[ A_1x^3 + B_1x^{-(2/m_1)+2} = 0. \]  (38)

Differentiating (38) with respect to \(x\) 4 times, we conclude that \(B(t) = c_2\) and hence \(A(t) = c_1\). Therefore,

\[ \xi = c_1x + c_2x^{-2/m_1}, \quad \text{where } m_1 = 4b - 1. \]  (39)

As a result of (39), we obtain

\[ \phi = bu\left(2c_1 - \frac{4}{m_1}c_2x^{-(2/m_1)-1}\right). \]  (40)

Using (39) and (40) into (12), we obtain

\[ -bu^2K_u\left(2c_1 - \frac{4}{m_1}c_2x^{-(2/m_1)-1} - \tau_ι + bt_\tau - uK\tau_ι\right) + \frac{8}{m_1}c_2(bu)^{(1/b)+1}\left(-\frac{2}{m_1}x^{-(2/m_1)-3}\right) \]

\[ -\frac{4}{m_1}c_2(bu)^{(1/b)+1}\left(-\frac{2}{m_1}x^{-(2/m_1)-3}\right) = 0. \]  (41)

Differentiating (41) with respect to \(x\) yields

\[ -bu^2K_u\left(-\frac{2}{m_1}x^{-(2/m_1)-2}\right) + \frac{8}{m_1}c_2(bu)^{(1/b)+1} \]

\[ \times\left(-\frac{2}{m_1}x^{-(2/m_1)+4} - \frac{4}{m_1}c_2(bu)^{(1/b)+1}\right) \]

\[ \times\left(-\frac{2}{m_1}x^{-(2/m_1)-4} = 0. \]  (42)
The above equation holds if $c_2 = 0$, and substituting this value into (41) gives
\[ -buK_u (2c_1 - \tau_t) + b\tau_{tt} - K\tau_t = 0. \]  
(43)

Differentiating (43) with respect to $t$
\[ -buK_u - K = \frac{-b\tau_{tt}}{\tau_t}. \]  
(44)
The equality in (44) holds if
\[ -buK_u - K = \frac{-b\tau_{tt}}{\tau_t} = \gamma, \]  
(45)
where $\gamma$ is a constant.

In accordance with (45), we conclude that
\[ \tau(t) = \frac{c_1b^2}{\gamma^2} \exp\left(\frac{\gamma t}{b}\right) + c_4 t + c_5, \]  
(46)
\[ K(u) = \gamma + \lambda u^{1/b}. \]  

Using (46) into (43) yields
\[ -2c_1\lambda u^{1/b} - \gamma c_4 = 0. \]  
(47)
Differentiating (47) with respect to $u$ leads to
\[ -2c_1 \frac{1}{b}\lambda u^{(1/b)-1} = 0. \]  
(48)

From (48) three cases arise, namely,

(a1) $c_1 = 0$, and $\lambda \neq 0$,

(a2) $c_1 \neq 0$ and $\lambda = 0$,

(a3) $c_1 = 0$ and $\lambda = 0$.

Subcase (a.1) ($D(u) = (bu)^{1/b}$ and $K(u) = \gamma + \lambda u^{1/b}$). Using these conditions arising in this case into (47), we obtain $c_4 = 0$ and hence the infinitesimals are determined
\[ \xi = 0, \quad \tau = \frac{c_1b}{\gamma} \exp\left(\frac{\gamma t}{b}\right) + c_5, \]  
\[ \phi = -c_3bu \exp\left(\frac{\gamma t}{b}\right). \]  
(49)
The two symmetry generators associated with the above infinitesimals are given by
\[ X_1 = \frac{b}{\gamma} \exp\left(\frac{\gamma t}{b}\right) \frac{\partial}{\partial t} - bu \exp\left(\frac{\gamma t}{b}\right) \frac{\partial}{\partial u}, \]  
\[ X_2 = \frac{\partial}{\partial t}. \]  
(50)
The commutation relation for these generators is given in Table 2.

Table 2: Commutator table of the tumor equation.

</tbody>
</table>

Subcase (a.2) ($D(u) = (bu)^{1/b}$ and $K(u) = \gamma$). Similarly, using these conditions arising in this case into (47), we obtain $c_4 = 0$ and hence the infinitesimals are determined
\[ \xi = c_1x, \quad \tau = \frac{c_1b}{\gamma} \exp\left(\frac{\gamma t}{b}\right) + c_5, \]  
\[ \phi = bu \left(2c_1 - \gamma \exp\left(\frac{\gamma t}{b}\right)\right). \]  
(51)
The three symmetry generators associated with the above infinitesimals are given by
\[ X_1 = \frac{b}{\gamma} \exp\left(\frac{\gamma t}{b}\right) \frac{\partial}{\partial t} - bu \exp\left(\frac{\gamma t}{b}\right) \frac{\partial}{\partial u}, \]  
\[ X_2 = x \frac{\partial}{\partial x} + 2bu \frac{\partial}{\partial u}, \]  
\[ X_3 = \frac{\partial}{\partial t}. \]  
(52)
The commutation relation for these generators is given in Table 3.

Table 3: Commutator table of the tumor equation.

<table>

</tbody>
</table>

Subcase (a.3) ($D(u) = (bu)^{1/b}$ and $K(u) = \gamma$). Using these conditions arising in this case into (47), we obtain $c_4 = 0$ and hence the infinitesimals are
\[ \xi = 0, \quad \tau = \frac{c_1b}{\gamma} \exp\left(\frac{\gamma t}{b}\right) + c_5, \]  
\[ \phi = -c_3bu \exp\left(\frac{\gamma t}{b}\right). \]  
(53)
The two symmetry generators associated with the above infinitesimals are given by
\[ X_1 = \frac{b}{\gamma} \exp\left(\frac{\gamma t}{b}\right) \frac{\partial}{\partial t} - bu \exp\left(\frac{\gamma t}{b}\right) \frac{\partial}{\partial u}, \]  
\[ X_2 = \frac{\partial}{\partial t}. \]  
(54)
The commutation relation for these generators is given in Table 4.

3.2.2. Subcase (b) ($b=1/4$). In accordance with this subcase, (35) becomes
\[ 2x\xi_x - 2\xi = 0; \quad \text{then } \xi = x\beta(t). \]  
(55)
Using (33) into (35) gives \( \beta = c_1 \) and hence
\[
\xi = c_1 x, \quad \phi = \frac{1}{4} u (2 c_1 - t_1).
\] (56)

Using (56) into (12) yields
\[
-\frac{1}{4} u K'_{\alpha} (2 c_1 - t_1) + \frac{1}{4} t_{11} - K t_1 = 0.
\] (57)

Differentiating (57) with respect to \( t \)
\[
-\frac{1}{4} u K'_{\alpha} - K = \frac{-(1/4) t_{111}}{t_{11}}.
\] (58)

The equality in (58) holds if
\[
-bu K'_{\alpha} - K = \frac{-(1/4) t_{111}}{t_{11}} = \gamma, \quad \text{where } \gamma \text{ is a constant.}
\] (59)

In accordance with (59), we have
\[
\tau (t) = \frac{c_1}{16 y^2} \exp (4yt) + c_4 t + c_5, \quad K (u) = \gamma + \lambda u^4.
\] (60)

Using (60) into (57) yields
\[
-2 c_1 \lambda u^4 - y c_4 = 0.
\] (61)

Differentiating (61) with respect to \( u \) leads to
\[
-8 c_1 \lambda u^3 = 0.
\] (62)

From (62) three cases arise:

(b.1) \( c_1 = 0 \), and \( \lambda \neq 0 \),

(b.2) \( c_1 \neq 0 \) and \( \lambda = 0 \),

(b.3) \( c_1 = 0 \) and \( \lambda = 0 \).

Subcase (b.1) \( (D(u) = ((1/4)u)^4 \text{ and } K(u) = \gamma) \). In accordance with this subcase and (61), we obtain \( c_4 = 0 \) and hence the infinitesimals are
\[
\xi = 0, \quad \tau = \frac{c_3}{4y} \exp (4yt) + c_5,
\] (63)

\[
\phi = -\frac{1}{4} c_3 u \exp (4yt).
\]

The generators associated with this subcase are
\[
X_1 = \frac{1}{4y} \exp (4yt) \frac{\partial}{\partial t} - \frac{1}{4} u \exp (4yt) \frac{\partial}{\partial u},
\] (64)

\[
X_2 = \frac{\partial}{\partial t}.
\]

Remark 1. Case (III) represents the particular case of (I) and (II). So by similar manipulation as in the previous cases, we obtain the same symmetry generators.

### 4. Some Reduction

In this section, we present solutions of (4) via reductions. These reductions are obtained by the similarity variables obtained through symmetry generators.
Case 1 ($K(u)$ and $D(u)$ are arbitrary). In this case, we have only one generator; that is, $X = \partial / \partial t$. Thus, the characteristic equation corresponding to this generator is
\[
\frac{dx}{0} = \frac{dt}{1} = \frac{du}{0}.
\] (69)
Solving the above equation it is straightforward [11] to find that it yields the similarity variables $r = x$ and $w = u$. Replacing $u$ in (4) in terms of new variables it becomes
\[
rD(w)w_{rr} + rD_ww_r^2 + 2D(w)w_r - rK(w)w = 0.
\] (70)
Case 2 ($K(u) = 0$ and $D(u)$ are arbitrary). We consider the generator $X_1 = x(\partial / \partial x) + 2t(\partial / \partial t)$. Thus, the characteristic equation associated with this generator is
\[
\frac{dx}{x} = \frac{dt}{2t} = \frac{du}{0}.
\] (71)
The similarity variables corresponding to the above equation become $r = xt^{-1/2}$ and $w = u$. These new variables reduce (4) to a ODE of the form
\[
r^2D(w)w_{rr} + r^2D_ww_r^2 + 2rD(w)w_r + r^3w_r = 0.
\] (72)
Choosing $D(w) = 1$ in the above equation, then the solution of the resulting equation is
\[
w(r) = c_2 + c_1 \left( -\frac{1}{r} \exp \left( -\frac{r^2}{4} \right) - \frac{1}{2} \sqrt{\Pi} \text{Erf} \left( \frac{r}{2} \right) \right).
\] (73)
Recasting the above equation in its original coordinates, the exact solution of (4) becomes
\[
u(x, t) = c_2 + c_1 \left( -\frac{\sqrt{t}}{x} \exp \left( -\frac{x^2}{4t} \right) - \frac{1}{2} \sqrt{\Pi} \text{Erf} \left( \frac{x}{2\sqrt{t}} \right) \right).
\] (74)
The graph of this solution is plotted in Figure 1.

Case 3 ($K(u) = \gamma + \lambda u^{1/b}$ and $D(u) = a(bu)^{1/b}$). We take the generator
\[
X_1 = \frac{b}{\gamma} \exp \left( \frac{\gamma}{b}t \right) \frac{\partial}{\partial t} - bu \exp \left( \frac{\gamma}{b}t \right) \frac{\partial}{\partial u}.
\] (75)
and its characteristic equation
\[
\frac{dx}{0} = \frac{\gamma}{b} \exp \left( -\frac{\gamma}{b}t \right) dt = \exp \left( -\frac{\gamma}{b}t \right) \frac{du}{-bu}.
\] (76)
gives the similarity variables $r = x$ with $w = \exp(\gamma t)u$. In accordance of these similarities, (4) is transformed to the ODE in the form
\[
rw_{rr} + \frac{r}{b}w_r^2 + 2w_r - r\lambda b^{-(1/b)}w = 0.
\] (77)
Choosing $b = \lambda = \gamma = 1$ in the above equation, then its solution becomes
\[
w(r) = c_2 \sqrt{r} \cosh \left( \sqrt{2}r + ic_1 \right).
\] (78)
Recasting the above equation in its original coordinates, the exact solution of (4) becomes
\[
u(x, t) = \exp (-t) \frac{c_2}{\sqrt{x}} \sqrt{\cosh (\sqrt{2}\sqrt{2t} + ic_1)}.
\] (79)
The graph of this solution is plotted in Figure 2.

Case 4 ($K(u) = \gamma$ and $D(u) = a(bu)^{1/b}$). In this case, we consider the generator
\[
X_1 = \frac{b}{\gamma} \exp \left( \frac{\gamma}{b}t \right) \frac{\partial}{\partial t} - bu \exp \left( \frac{\gamma}{b}t \right) \frac{\partial}{\partial u}.
\] (80)
The characteristic equation corresponding to this generator is
\[
\frac{dx}{0} = \frac{\gamma}{b} \exp \left( -\frac{\gamma}{b}t \right) dt = \exp \left( -\frac{\gamma}{b}t \right) \frac{du}{-bu}.
\] (81)
solving the above characteristic equation gives $r = x$ with $w = \exp(\gamma t)u$. These variables can be used to recast (4) to an ODE,
\[w_{rr} + \frac{r}{b}w_r^2 + 2w_r = 0.
\] (82)
Choosing \( b = (1/4) \) in (82), then its solution becomes
\[
\omega(r) = \left( \frac{-r}{5(c_1 - c_2 r)} \right)^{-1/5}.
\]  
(83)

Recasting the above equation in its original coordinates, the exact solution of (4) becomes
\[
u(x,t) = \exp(-\gamma t) \left( \frac{-x}{5(c_1 - c_2 x)} \right)^{-1/5}.
\]  
(84)

The graph of this solution is plotted in Figure 3.
