Weak convergence of semi-Markov processes in the diffusive approximation scheme is studied in the paper. This problem is not new and it is studied in many papers, using convergence of random processes. Unlike other studies, we used in this paper concept of the compensating operator. It enables getting sufficient conditions of weak convergence under the conditions on the local characteristics of output semi-Markov process.

1. Introduction

Weak convergence conditions for semi-Markov stochastic processes in the diffusion approximation scheme without balance condition are studied in the paper. Theory of Markov and semi-Markov processes is used in security market (Black-Scholes equation, Vasicek model, and their modifications) [1], queuing systems [2, 3], engineering [4], biology [5], climate models [6, 7], and publicity models [8]. But numerous papers were devoted to problems of Markov processes convergence. This approach produces errors of mathematical model because exponential distribution of sojourn time in states is supposed. The supposition enables staying in the state any time with nonzero probability. This is unacceptable in physics systems. That is why the subject of this research is semi-Markov processes. Beside this, other techniques of weak convergence research are used in many papers. In this case authors get different sufficient conditions of the convergence. For example, in [9] author states his results as solution of some martingale problem. It complicates testing these conditions. In [3] author focuses on the convergence of characteristic functions and claims the convergence of characteristic functions for prelimited processes. In [10] author claims the convergence of the generators of the prelimited processes to the generator of some diffusion process.

In contrast to abovelisted works, only moment's conditions on the semi-Markov process local characteristic are

used in this paper. Using the term of compensating operator makes it possible to not use convergence of the generators of prelimited processes.

2. Main Result

Consider the conditions of weak convergence of semi-Markov random processes (SMP) in diffusion approximation scheme. Consideration of these problems can be found in [3, 9–15]. Let us consider SMP $\eta(t)$, $t \geq 0$, on the probability space (Ω, F, P) [11, 16, 17] in Euclidian space R_d , $d \geq 1$, which is generated by the Markov renewal process (MRP)

$$(\eta_n, \tau_n), \quad n \geq 0; \quad (1)$$

that is

$$\eta(t) = \eta_{\nu(t)}, \quad (2)$$

where $\nu(t) := \max\{n \geq 0 : \tau_n < t\}$ is the counting process.

Denote the sojourn time in states $\theta_n := \tau_n - \tau_{n-1}$, $n \geq 0$. MRP is determined by semi-Markov kernel, which sets conditional probabilities of jump's values, and by distribution of the sojourn time in states:

$$\begin{aligned} Q(u, dv, t) &:= P\{\Delta\eta_{n+1} \in dv, \theta_{n+1} \leq t \mid \eta_n = u\} \\ &= \Gamma(u, dv) F_u(t), \end{aligned} \quad (3)$$

where $u \in R^d$, $dv \in \beta_{R^d}$, $t \geq 0$, $\Delta\eta_{n+1} = \eta_{n+1} - \eta_n$, β_{R^d} is the Borel σ -algebra on R^d , and

$$\begin{aligned}\Gamma(u, dv) &:= P\{\Delta\eta_{n+1} \in dv \mid \eta_n = u\}, \\ F_u(t) &:= P\{\theta_{n+1} \leq t \mid \eta_n = u\}.\end{aligned}\quad (4)$$

Note that in this section the important fact will be one when the kernel $Q(u, dv, t)$ has decomposition:

$$Q(u, dv, t) = \Gamma(u, dv) F_u(t) \quad (5)$$

because in general this assumption is not valid.

In this paper suppose that balance condition did not hold; it means that

$$a(u) := \int_{R^d} v \Gamma(u, dv) \neq 0. \quad (6)$$

In this case it is impossible to consider the process in the scheme of diffusive approximation, which is defined by relation

$$\zeta^\varepsilon(t) := \varepsilon \eta(\varepsilon^{-2}t) \quad (7)$$

because it is impossible to write the asymptotic representation of compensating operator (CO) of the process. That is why we consider semi-Markov process $\eta^\varepsilon(t)$, $t \geq 0$, in averaging scheme, which is defined by equation

$$\eta^\varepsilon(t) := \varepsilon \eta(\varepsilon^{-1}t). \quad (8)$$

We can prove weak convergence of the process $\eta^\varepsilon \Rightarrow \rho$, where ρ is the solution of differential equation

$$\frac{d\rho(t)}{dt} = C(\rho(t)), \quad (9)$$

where

$$\begin{aligned}C(u) &= a(u) b(u), \\ b(u) &:= (\lambda(u))^{-1}, \\ \lambda(u) &:= \int_0^\infty t dF_u(t).\end{aligned}\quad (10)$$

Consider stochastic process:

$$\xi^\varepsilon(t) := \varepsilon^{-1}(\varepsilon^2 \eta(\varepsilon^{-2}t) - \rho(t)). \quad (11)$$

According to (11), we get

$$\begin{aligned}\tau_n^\varepsilon &= \varepsilon^2 \tau_n, \\ \theta_n^\varepsilon &= \varepsilon^2 \theta_n.\end{aligned}\quad (12)$$

Let us define

$$\begin{aligned}\xi_n^\varepsilon &:= \varepsilon \eta(\tau_n) - \varepsilon^{-1} \rho(\varepsilon^2 \tau_n), \\ \rho_n^\varepsilon &= \rho(\varepsilon^2 \tau_n).\end{aligned}\quad (13)$$

Consider compensating operator for some process.

Definition 1. The compensating operator Γ^ε for SMP $\xi^\varepsilon(t)$, $t \geq 0$, is defined by the relation

$$\begin{aligned}\Gamma^\varepsilon \varphi(u, t) &:= \frac{E[\varphi(\xi_{n+1}^\varepsilon, \tau_{n+1}^\varepsilon) - \varphi(\xi_n^\varepsilon, \tau_n^\varepsilon) \mid \xi_n^\varepsilon = u, \tau_n^\varepsilon = t]}{E[\theta_{n+1}^\varepsilon \mid \xi_n^\varepsilon = u]}\end{aligned}\quad (14)$$

on the test-functions $\varphi(u, t)$.

In this case there is a weak convergence SMP in the scheme of diffusive approximation without balance conditions.

Theorem 2. Let the following conditions be satisfied:

(D1) Uniform integrability (bounded time in states):

$$\lim_{T \rightarrow \infty} \sup_{u \in R^d} \int_T^\infty \bar{F}(t) dt = 0. \quad (15)$$

(D2) $\exists C, C_1 > 0$, that inequality

$$\begin{aligned}E e^{-\varepsilon \theta_u} &\leq 1 - C\varepsilon, \\ D\theta_u &< C_1\end{aligned}\quad (16)$$

is uniform by $u \in R^d$ and $\varepsilon > 0$.

(D3) Boundary of the second moment of jump's value:

$$\sup_{u \in R^d} \left\| \int_{R^d} v v^T \Gamma_\varepsilon(u, dv) \right\| < \infty. \quad (17)$$

(D4) Kernel $\Gamma_\varepsilon(u, dv)$ satisfies the following conditions:

$$\begin{aligned}a^\varepsilon(z, u) &= \int_{R^d} v \Gamma_\varepsilon(z + \varepsilon u, dv) \\ &= a(z) + \varepsilon a_1(z, u) + \varepsilon \delta_1^\varepsilon, \\ B^\varepsilon(z, u) &= \int_{R^d} v v^T \Gamma_\varepsilon(z + \varepsilon u, dv) = B(z) + \varepsilon \delta_2^\varepsilon,\end{aligned}\quad (18)$$

where $\delta_1^\varepsilon, \delta_2^\varepsilon \rightarrow 0$, $\varepsilon \rightarrow 0$.

(D5) Function $b(u)$ satisfies the condition

$$b(\rho + \varepsilon u) = b(\rho) + \varepsilon \delta_3^\varepsilon, \quad \delta_3^\varepsilon \rightarrow 0, \quad \varepsilon \rightarrow 0. \quad (19)$$

(D6) Convergence of the initial conditions is as follows:

$$\begin{aligned}\xi^\varepsilon(0) &\rightarrow \xi(0), \\ \sup_{\varepsilon > 0} E |\xi^\varepsilon(0)| &< \infty.\end{aligned}\quad (20)$$

Then weak convergence takes place in $D([0, T])$, $T < \infty$, as $\varepsilon \downarrow 0$:

$$\xi^\varepsilon \Rightarrow \xi^0, \quad (21)$$

where $\xi^0(t)$, $t \geq 0$, is the diffusion process with generator

$$\begin{aligned}\Gamma_t^0 \varphi(u) &= C_1(u, \rho(t)) \varphi'(u) \\ &\quad + \frac{1}{2} \tilde{B}(\rho(t)) \varphi''(u), \\ C_1(u, \rho(t)) &:= b(\rho(t)) a_1(\rho(t), u), \\ \tilde{B}(\rho(t)) &:= b(\rho(t)) \sigma^2(\rho(t)), \\ \sigma^2(u) &:= B(u) - a^2(u).\end{aligned}\quad (22)$$

Remark 3. Boundary operator depends on the averaged evolution ρ ; that is why it is advisable to consider weak convergence of two-component evolution $(\xi^\varepsilon, \rho^\varepsilon)$. But, according to [11, 18–20], we will prove theorem only for the process, which consists of parameter of series ε , in other words ξ^ε .

The proof of Theorem 2 consists of two steps.

Step 1. Let us solve the problem of the singular perturbation for CO of process ξ^ε as $\varepsilon \downarrow 0$.

Consider an evolution equation

$$\frac{d\rho(t)}{dt} = C(\rho(t)) \quad (23)$$

that corresponds with

$$C\varphi(v) = C(v) \varphi'(v) \quad (24)$$

and with semigroup

$$C_t \varphi(v) = \varphi\left(v + \int_0^t C(\rho(s)) ds\right). \quad (25)$$

By analogues, an evolution equation

$$\frac{d\rho^\varepsilon(t)}{dt} = -\varepsilon^{-1} C(\rho^\varepsilon(t)) \quad (26)$$

corresponds with operator

$$C^\varepsilon \varphi(v) = -\varepsilon C(v) \varphi'(v) \quad (27)$$

with semigroup

$$C_t^\varepsilon \varphi(v) = \varphi\left(v - \varepsilon^{-1} \int_0^t C(\rho(s)) ds\right). \quad (28)$$

Lemma 4. CO of two-component process $(\xi^\varepsilon, \rho^\varepsilon)$ on test-functions $\varphi \in C(R^{2d})$ is given by

$$\begin{aligned}\Gamma^\varepsilon \varphi(u, v) &= \varepsilon^{-2} b(v + \varepsilon u) \int_0^\infty F_{v+\varepsilon u}(ds) \\ &\quad \cdot \int_{R^d} [C_{\varepsilon^2 s} C_{\varepsilon^2 s}^\varepsilon \Delta_{\varepsilon z} \varphi(u, v) - \varphi(u, v)] \\ &\quad \cdot \Gamma_\varepsilon(v + \varepsilon u, dz),\end{aligned}\quad (29)$$

where

$$\Delta_{\varepsilon z} \varphi(u, v) := \varphi(u + \varepsilon z, v). \quad (30)$$

Proof. By Definition 1, we got a relation for values of jumps and time of renewals:

$$\begin{aligned}\Delta \xi_{n+1}^\varepsilon &= \varepsilon \Delta \eta_{n+1}^\varepsilon - \varepsilon^{-1} \Delta \rho_{n+1}^\varepsilon, \\ \tau_n^\varepsilon &= \varepsilon^2 \tau_n.\end{aligned}\quad (31)$$

Then

$$\Delta \rho_{n+1}^\varepsilon = \int_0^{\varepsilon^2 \theta_{n+1}} C(\rho(\varepsilon^2 \tau_n + h)) dh. \quad (32)$$

So, according to the condition $\rho_n^\varepsilon = v$ we get

$$\varphi(u, \rho_{n+1}^\varepsilon) = \varphi(u, \rho_n^\varepsilon + \Delta \rho_{n+1}^\varepsilon) = C_{\varepsilon^2 \theta_{n+1}} \varphi(u, v). \quad (33)$$

For embedded chain ξ_n^ε , $n \geq 0$, we get

$$\begin{aligned}E[\varphi(\xi_{n+1}^\varepsilon, v) | \xi_n^\varepsilon = u] &= E[\varphi(\xi_n^\varepsilon + \Delta \xi_{n+1}^\varepsilon, v) | \xi_n^\varepsilon \\ &= u] = E[\varphi(\xi_{n+1}^\varepsilon, v) | \xi_n^\varepsilon = u] = E\left[\varphi\left(\xi_n^\varepsilon\right.\right. \\ &\quad \left.\left.+ \Delta \eta_{n+1}^\varepsilon - \varepsilon^{-1} \int_0^{\varepsilon^2 \theta_{n+1}} C(\rho(\varepsilon^2 \tau_n + h)) dh, v\right) | \xi_n^\varepsilon\right. \\ &\quad \left.= u\right] = C_{\varepsilon^2 s}^\varepsilon \Delta_{\varepsilon \theta_{n+1}} \varphi(u, v).\end{aligned}\quad (34)$$

Then calculate

$$\begin{aligned}\Gamma^\varepsilon \varphi(u, v) &= \frac{E[\varphi(\xi_{n+1}^\varepsilon, \rho_{n+1}^\varepsilon) - \varphi(u, v) | \xi_n^\varepsilon = u, \rho_n^\varepsilon = v]}{E[\theta_{n+1}^\varepsilon | \xi_n^\varepsilon = u]} \\ &= \varepsilon^{-2} b(v + \varepsilon u) E[\varphi(\xi_n^\varepsilon + \Delta \xi_{n+1}^\varepsilon, \rho_n^\varepsilon + \Delta \rho_{n+1}^\varepsilon) \\ &\quad - \varphi(u, v) | \eta_n = u + \varepsilon v].\end{aligned}\quad (35)$$

So, finally we get representation of the compensating operator for two-component evolution $(\xi^\varepsilon, \rho^\varepsilon)$:

$$\begin{aligned}\Gamma^\varepsilon \varphi(u, v) &= \varepsilon^{-2} b(v + \varepsilon u) \int_0^\infty F_{v+\varepsilon u}(ds) \\ &\quad \cdot \int_{R^d} [C_{\varepsilon^2 s} C_{\varepsilon^2 s}^\varepsilon \Delta_{\varepsilon z} \varphi(u, v) - \varphi(u, v)] \\ &\quad \cdot \Gamma_\varepsilon(v + \varepsilon u, dz),\end{aligned}\quad (36)$$

as we wanted to show.

Lemma 4 is proved. $\square$

Consider asymptotic behavior of CO, from Lemma 4 as $\varepsilon \downarrow 0$.

Lemma 5. On test-functions $\varphi(u, v) \in C^\infty(R^{2d})$ CO of the process $(\xi^\varepsilon, \rho^\varepsilon)$ has asymptotic representation

$$\Gamma^\varepsilon \varphi(u, v) = \Gamma^0 \varphi(u, v) + R^\varepsilon \varphi(u, v), \quad (37)$$

where Γ^0 is given by the following relation:

$$\begin{aligned} \Gamma^0 \varphi(u, v) &= C_1(v, u) \varphi'_u(u, v) + \frac{1}{2} B(v) \varphi''_u(u, v) \\ &\quad + C(v) \varphi'_v(u, v) \end{aligned} \quad (38)$$

and for the negligible term,

$$\lim_{\varepsilon \downarrow 0} \sup_{u, v \in \mathbb{R}^d} |\Gamma^\varepsilon \varphi(u, v)| = 0 \quad (39)$$

is true.

Proof. Let us use an algebraic identity

$$\begin{aligned} (abc - 1) &= (a - 1) + (b - 1) + (c - 1) \\ &\quad + (a - 1)(b - 1) + (a - 1)(c - 1) \\ &\quad + (b - 1)(c - 1) \\ &\quad + (a - 1)(b - 1)(c - 1). \end{aligned} \quad (40)$$

According to Lemma 4 and algebraic identity (40) we get

$$\begin{aligned} \Gamma^\varepsilon \varphi(u, v) &= \varepsilon^{-2} b(v + \varepsilon u) \int_0^\infty F_{v+\varepsilon u}(ds) \\ &\quad \cdot \int_{\mathbb{R}^d} [(C_{\varepsilon^2 s} - I) + (C_{\varepsilon^2 s}^\varepsilon - I) + (\Delta_{\varepsilon z} - I) + o(\varepsilon)] \\ &\quad \cdot \varphi(u, v) \Gamma_\varepsilon(v + \varepsilon u, dz) = I_1 + I_2 + I_3 + I_4. \end{aligned} \quad (41)$$

Let us use the equations for semigroups [9]:

$$\begin{aligned} (C_{\varepsilon^2 s} - I) &= C \int_0^{\varepsilon^2 s} C_{\varepsilon^2 h} dh, \\ (C_{\varepsilon^2 s}^\varepsilon - I) &= C^\varepsilon \int_0^{\varepsilon^2 s} C_{\varepsilon^2 h}^\varepsilon dh. \end{aligned} \quad (42)$$

Then for the term I_1 , by semigroups properties and condition (D5), we get the following relation:

$$\begin{aligned} I_1 &= \varepsilon^{-2} b(v + \varepsilon u) \int_0^\infty F_{v+\varepsilon u}(ds) \int_{\mathbb{R}^d} C \\ &\quad \cdot \int_0^{\varepsilon^2 s} C_{\varepsilon^2 h} dh \varphi(u, v) \Gamma_\varepsilon(v + \varepsilon u, dz) = b(v + \varepsilon u) \\ &\quad \cdot \int_0^\infty F_{v+\varepsilon u}(ds) \int_{\mathbb{R}^d} C s \varphi(u, v) \Gamma_\varepsilon(v + \varepsilon u, dz) \\ &= C(v) \varphi'_v(u, v) + o(\varepsilon). \end{aligned} \quad (43)$$

Similarly for $I_2 + I_3$ we get

$$\begin{aligned} I_2 + I_3 &= \varepsilon^{-2} b(v + \varepsilon u) \int_0^\infty F_{v+\varepsilon u}(ds) \\ &\quad \cdot \int_{\mathbb{R}^d} ((C_{\varepsilon^2 s}^\varepsilon - I) + (\Delta_{\varepsilon z} - I)) \varphi(u, v) \Gamma_\varepsilon(v + \varepsilon u, dz) \\ &= C_1(v, u) \varphi'_u(u, v) + \frac{1}{2} B(v) \varphi''_u(u, v) + o(\varepsilon). \end{aligned} \quad (44)$$

From factorization $[C_{\varepsilon^2 s} C_{\varepsilon^2 s}^\varepsilon \Delta_{\varepsilon z} - I]$, according to (40), terms $C_{\varepsilon^2 s} - I$, $(C_{\varepsilon^2 s}^\varepsilon - I) + (\Delta_{\varepsilon z} - I)$ were considered. Γ^0 is built by these terms. It is easy to check that the sum of the rest of the terms is $o(1)$ as $\varepsilon \downarrow 0$, if conditions (D3)–(D5) hold.

Using representation for semigroups $C_{\varepsilon^2 s}$, $C_{\varepsilon^2 s}^\varepsilon$, and $\Delta_{\varepsilon z}$, it is easy to show that negligible term is $o(1)$ as $\varepsilon \downarrow 0$.

Lemma 5 is proved. $\square$

Step 2. Let us show the relative compactness of the processes family ξ^ε as $\varepsilon > 0$. We will use Theorem 1.4.6 from [21]. Let us formulate and prove the statement we need to use this theorem.

Remark 6. Conditions of relative compactness can also be found in [22, 23].

Lemma 7. *There is an inequality*

$$|\Gamma^\varepsilon \varphi(u, v)| \leq C_\varphi \quad (45)$$

for test-functions $\varphi \in C_0^{3,2}(\mathbb{R}^{2d})$, where constant C_φ depends only on function φ .

For function $\varphi_0(u, v) = \sqrt{1 + u^2 + v^2}$ there is a bound

$$|\Gamma^\varepsilon \varphi_0(u, v)| \leq C_l \varphi_0(u, v), \quad |u| \leq l, \quad (46)$$

where constant C_l depends only on the function φ_0 , independent from ε .

Proof. Let us use the result of Lemma 5:

$$\begin{aligned} |\Gamma^\varepsilon \varphi(u, v)| &\leq |\Gamma^0 \varphi(u, v)| + |R^\varepsilon \varphi(u, v)| \leq \sup_{u, v \in \mathbb{R}^{2d}} |b(v)| \\ &\quad \cdot a_1(u, v) \varphi'_u(u, v) + C(v) \varphi'_v(u, v) + \sup_{u, v \in \mathbb{R}^{2d}} \left| \frac{1}{2} \left(b(v) B(v) \right. \right. \\ &\quad \left. \left. + \int_0^\infty s^2 F_v(ds) C^2(v) - 2C(v) a(v) \right) \varphi''_{uu} \right| \\ &\quad + \sup_{u, v \in \mathbb{R}^{2d}} |R^\varepsilon \varphi(u, v)|. \end{aligned} \quad (47)$$

According to the definition of test-function φ we have $\sup_{u, v \in \mathbb{R}^{2d}} \max\{|\varphi|, |\varphi'_u|, |\varphi'_v|, |\varphi''_{uu}|\} \leq K < \infty$. To prove the lemma, condition (D3) for a boundary of the first and the second moments, condition (D4), and condition (D2) remain to be used, from which it follows that $|b(u)| < c < \infty$.

Then

$$|\Gamma^\varepsilon \varphi(u, v)| \leq cK_1(1 + \varepsilon) < C_\varphi, \quad (48)$$

where constant $K_1 = K_1(\varphi)$ depends only on φ , $C_\varphi = 2cK_1$.

To prove condition (46) the properties of the function φ_0 remain to be remembered; namely

$$\begin{aligned} (\varphi_0)'_u &\leq 1 \leq \varphi_0, \\ (\varphi_0)'_v &\leq 1 \leq \varphi_0, \\ (\varphi_0)'_{uu} &\leq 1 \leq \varphi_0, \\ (\varphi_0)'_{vv} &\leq 1 \leq \varphi_0. \end{aligned} \quad (49)$$

Lemma 7 is proved. $\square$

Lemma 8. ζ^ε , $\varepsilon > 0$, is relatively compact family.

Proof. To determine the relative compactness of the family ζ^ε , $\varepsilon > 0$, according to Theorem 1.4.6 [21] submartingality of the stochastic process $\alpha^\varepsilon(t) = \varphi(\zeta^\varepsilon(t)) + C_\varphi t$ for nonnegative infinitely differentiable φ and for some constant C_φ and inequality (45) and (46) remains to be shown, where $\zeta^\varepsilon(t) = (\zeta^\varepsilon(t), \rho(t))$.

Let us prove that stochastic process $\zeta^\varepsilon(t)$ is nonnegative submartingale relatively to the stream of σ -algebras $F_t^\varepsilon := \sigma(\tau_+^\varepsilon(s), s \leq t)$, $\tau_+^\varepsilon(t) = \tau_+(t) + 1$:

$$\begin{aligned} & E[\alpha^\varepsilon(t) - \alpha^\varepsilon(s) | F_t^\varepsilon] \\ &= E[\varphi(\zeta^\varepsilon(t)) - \varphi(\zeta^\varepsilon(s)) | F_t^\varepsilon] + C_\varphi(t - s) \\ &= E\left[\int_s^t \Gamma^\varepsilon \varphi(\zeta^\varepsilon(u)) du | F_t^\varepsilon\right] + C_\varphi(t - s) \\ &= E\left[\int_{\tau_+^\varepsilon(s)}^{\tau_+^\varepsilon(t)} (\Gamma^\varepsilon \varphi(\zeta^\varepsilon(u)) + C) du | F_t^\varepsilon\right] \\ &\quad + E\left[\left(\int_s^{\tau_+^\varepsilon(s)} + \int_{\tau_+^\varepsilon(t)}^t\right) (\Gamma^\varepsilon \varphi(\zeta^\varepsilon(u)) + C) du | F_t^\varepsilon\right] \\ &\quad + C(t - \tau_+^\varepsilon(t) - s + \tau_+^\varepsilon(s)). \end{aligned} \quad (50)$$

Two last terms tend to 0 as $\varepsilon \downarrow 0$. By Lemma 7

$$E\left[\int_{\tau_+^\varepsilon(s)}^{\tau_+^\varepsilon(t)} (\Gamma^\varepsilon \varphi(\zeta^\varepsilon(u)) + C) du | F_t^\varepsilon\right] \geq 0. \quad (51)$$

Measurability of the process α^ε relatively to the stream F^ε is obvious. So, α^ε is nonnegative submartingale.

Lemma 8 is proved. $\square$

According to Lemma 8 ζ^ε , $\varepsilon > 0$, is a relatively compact family. To complete the proof of the theorem the family ζ^ε that converges to martingale remains to be shown. Consider stochastic processes:

$$\begin{aligned} \zeta_+^\varepsilon(t) &:= \zeta^\varepsilon(\tau_+^\varepsilon(t)), \\ \zeta_\tau^\varepsilon(t) &:= \zeta^\varepsilon(\tau^\varepsilon(t)), \\ &t \geq 0, \end{aligned} \quad (52)$$

$$\mu_t^\varepsilon := \varphi(\zeta^\varepsilon(t)) - \int_0^t \Gamma^0 \varphi(\zeta^\varepsilon(s)) ds.$$

Then

$$\begin{aligned} E\mu_t^\varepsilon &= E\left(\varphi(\zeta^\varepsilon(t)) - \int_0^t \Gamma^0 \varphi(\zeta^\varepsilon(s)) ds\right) \\ &= E(\varphi(\zeta^\varepsilon(t)) - \varphi(\zeta_+^\varepsilon(t))) \end{aligned}$$

$$\begin{aligned} &+ E\left(\varphi(\zeta_+^\varepsilon(t)) - \int_0^t \Gamma^\varepsilon \varphi(\zeta_+^\varepsilon(s)) ds\right) \\ &+ E\left(\int_t^{\tau_+^\varepsilon(t)} \Gamma^0 \varphi(\zeta^\varepsilon(s)) ds\right) \\ &+ E\left(\int_t^{\tau_+^\varepsilon(t)} \Gamma^\varepsilon (\varphi(\zeta_+^\varepsilon(s)) - \varphi(\zeta^\varepsilon(s))) ds\right) \\ &+ E\left(\int_t^{\tau_+^\varepsilon(t)} (\Gamma^\varepsilon \varphi(\zeta^\varepsilon(s)) - \Gamma^0 \varphi(\zeta^\varepsilon(s))) ds\right). \end{aligned} \quad (53)$$

According to Lemma 7 the third term satisfies the relation

$$E\left(\int_t^{\tau_+^\varepsilon(t)} \Gamma^0 \varphi(\zeta^\varepsilon(s)) ds\right) \rightarrow 0. \quad (54)$$

By the same way we can prove that the first and the fourth terms tend to 0, because φ is continuous.

The last term tends to 0 by Lemma 5, because

$$\lim_{\varepsilon \downarrow 0} \Gamma^\varepsilon \varphi(u) = \Gamma^0 \varphi(u) \quad (55)$$

on test-functions φ , which have uniform bounded derivatives of any order.

The second term is equal to

$$\vartheta_t^\varepsilon := \varphi(\zeta_+^\varepsilon(t)) - \int_0^t \Gamma^\varepsilon \varphi(\zeta_+^\varepsilon(s)) ds \quad (56)$$

and has a martingale condition according to Lemma 6.1 [11].

Let us use its martingale condition:

$$E\vartheta_t^\varepsilon := E\zeta^\varepsilon(0) = E\varphi(\zeta^\varepsilon(0)). \quad (57)$$

Finally we have

$$E\mu_t^\varepsilon = E\varphi(\zeta^\varepsilon(0)) + r^\varepsilon, \quad (58)$$

where $r^\varepsilon \rightarrow 0$ as $\varepsilon \downarrow 0$.

Now from theorem's condition (D6) we get

$$E\mu_t = E\varphi(\zeta(0)); \quad (59)$$

in another words, ζ is martingale.

So, we have checked all conditions of the weak convergence, namely, the compactness of the processes family and the martingality of the limited process. Beside this according to Lemma 5 CO converges to the generator of diffusion process.

Theorem 2 is proved.

3. Numerical Example

Consider semi-Markov process $\eta(t)$, $t \geq 0$, in R^1 . For this process $\Gamma(u, dv)$ has uniform distribution on $[u - 1/2, u + 1/2]$

FIGURE 1: Diffusion approximation with epsilon = 0.1.

FIGURE 2: Diffusion approximation with epsilon = 0.01.

and $\theta_{n+1} \mid \eta_n = u$ has Bernoulli distribution with parameters $(4, 1/2)$. Then

$$a(u) = u \neq 0 \quad (60)$$

and average evolution $\rho(t)$, $t > 0$, has representation

$$\rho(t) = \rho_0 e^{t/2}, \quad (61)$$

where ρ_0 are initial condition. It is easy to verify the conditions of the theorem. Prelimited processes are shown in Figures 1 and 2 for $\varepsilon = 10^{-1}, 10^{-2}$.

4. Conclusions

Weak convergence of semi-Markov processes in the diffusive approximation scheme on conditions on the local characteristics of semi-Markov process is studied in this paper.

Conflict of Interests

The author declares that there is no conflict of interests regarding the publication of this paper.
