The representation of chemical compounds and chemical networks with the M-polynomials is a new idea, and it gives nice and good results of the topological indices. These results are used to correlate the chemical compounds and chemical networks with their chemical properties and bioactivities. In this article, particular attention will be put on the derivation of M-polynomial for the benzene ring embedded in the P-type surface network in 2D. Furthermore, the topological indices based on the degrees are also derived by using the general form of M-polynomial of the benzene ring embedded in the P-type surface network BR(m, n). In the end, the graphical representation and comparison of the M-polynomial and the topological indices of the benzene ring embedded in the P-type surface network in 2D are described.

1. Introduction

The chemical compounds can be represented by using the mathematical tools of graph theory. The mathematical models that are based on the polynomials of the chemical compounds and crystal structures can be used in order to predict and forecast their chemical properties and bioactivities. Mathematical chemistry is rich in tools like functions and polynomials which predict the properties of molecular graphs and crystal structures. The topological descriptors are the numerical parameters of the chemical graph which characterize its topology and are usually graph invariants. They explain the structure of chemical compounds mathematically and are utilized in the study of quantitative structure property and activity relationships (QSPR/QSAR).

A topological index is a numerical value which describes and explains an important information about the chemical structure. A great variety of such indices are studied and used in theoretical chemistry, pharmaceutical research, drugs, and different areas of science. The properties like boiling point, strain energy, viscosity, fracture toughness, and heat of formation are connected to the chemical structure under study. This fact plays a major role in the field of chemical graph theory [1–22].

The computation of the general polynomial is formed whose derivatives or integrals or composition of both are evaluated at some particular point. Then, the simplified form yields the molecular descriptor. For instance, there are polynomials like forgotten polynomials, Zagreb polynomials, and Hosoya polynomials, but these polynomials give rise to one or two topological indices [23–26]. The Hosoya polynomial is a polynomial whose derivatives evaluated at 1 give Wiener and hyper Wiener index [27]. The Hosoya polynomial and Zagreb polynomials are considered to be of the general form in the determination of distance-based and degree-based indices, respectively. The M-polynomial is a new and recent polynomial. It will open up new results of chemical graphs and insights in the study of topological descriptors based on degrees. The main importance of this polynomial is that it can give exact forms of more than ten degree-based molecular
Randić proposed and formulated the Randić index of a mathematical and chemical applications [31, 32]. Later on, Milan Gutman and Trinajstić [25, 39, 40]. Both first and second Zagreb indices are introduced by Bollobás et al. [33] and Amić et al. [34]. Let $R_{-1/2}(G)$ be the general Randić index and inverse Randić index are formulated as

$$R_{u}(G) = \sum_{uv \in E(G)} \frac{1}{d_u d_v},$$

$$RR_{u}(G) = \sum_{uv \in E(G)} \frac{1}{d_u d_v}.$$

The first and second Zagreb indices are introduced by Gutman and Trinajstić [25, 39, 40]. Both first and second Zagreb indices and the second modified index are formulated as

$$M_1(G) = \sum_{uv \in E(G)} (d_u + d_v),$$

$$M_2(G) = \sum_{uv \in E(G)} (d_u d_v),$$

$$mM_2(G) = \sum_{uv \in E(G)} \frac{1}{d_u d_v}.$$

Recently, the symmetric division deg index of a graph $G$ is introduced [41]. It is the significant index which is used to determine the total surface area of polychlorobiphenyls [42] and is defined as

$$SDD(G) = \sum_{uv \in E(G)} \left( \min(d_u, d_v) \max(d_u, d_v) + \min(d_u, d_v) \max(d_u, d_v) \right).$$

The other version of the Randić index is the harmonic index [43] and is defined as

$$H(G) = \sum_{uv \in E(G)} \frac{2}{d_u + d_v}.$$

The inverse sum index is formulated as [44]

$$I(G) = \sum_{uv \in E(G)} \frac{d_u d_v}{d_u + d_v}.$$

The augmented Zagreb index gives best approximation of heat of formation of alkanes [45, 46]. It is formulated as [47]

$$A(G) = \sum_{uv \in E(G)} \left( \frac{d_u d_v}{d_u + d_v - 2} \right).$$

Let $M(G; x, y) = f(x, y)$, and then Table 1 relates above described topological indices with M-polynomial [28], where

$$Q_u(f(x, y)) = x^u f(x, y),$$

$$J(f(x, y)) = f(x, x),$$

$$S_x = \int_0^x \frac{f(t, y)}{t} \, dt,$$

$$S_y = \int_0^y \frac{f(x, t)}{t} \, dt,$$

$$D_x = x \frac{\partial (f(x, y))}{\partial x},$$

$$D_y = y \frac{\partial (f(x, y))}{\partial y}.$$

### 2. Main Results and Discussion

O’Keeffe et al. have distributed around a quarter century a letter managing two 3D systems of benzene, and one of the structures was known as 6.82P (or additionally polybenzene) and has a place with the space gather Im3m, compared with the P-type surface [48]. Actually, this is insertion of the hexagon fix in the surface of negative ebb and flow P. The P-type surface is coordinated to the Cartesian arranges in the Euclidean space. The reader can discover more about this intermittent surface in [49, 50]. This structure was required to be combined as 3D carbon solids and no such combination was accounted before. This has aroused a lot of research enthusiasm of researchers to carbon nanoscience. As much as the graphenes were picked up a moment Nobel prize after C60, fullerenes have also been studied in depth, see detail in [51, 52].

The molecular graph of the benzene ring embedded in the P-type surface network is depicted in Figure 1. The cardinality of vertices and edges of the given molecular graph are $24m$ and $32m – 2m – 2n$, respectively. The vertex set consists of two vertex partitions in the benzene ring embedded in the P-type surface network, as shown in Table 2. Furthermore, the edge set consists of three edge partitions. The first edge partition contains $4m + 4n$ edges $uv$, where $\deg(u) = \deg(v) = 2$. The second edge partition

Figure 1: Chemical graph of the benzene ring embedded in a P-type surface network in 2D.

contains 16mn edges \( uv \), where \( \deg(u) = 2 \) and \( \deg(v) = 3 \). The third edge partition contains \( 16mn - 2m - 2n \) edges \( uv \), where \( \deg(u) = \deg(v) = 3 \). Table 3 shows the edge partition in the benzene ring embedded in the P-type surface network. We compute the M-polynomial of the benzene ring embedded in the P-type surface network. Also, we present the graphical representation of this graph in 2D and 3D by using Maple 13. In the end, we compute and simplify the topological indices by using the M-polynomial of the benzene ring embedded in the P-type surface network.

3. M-Polynomial of Benzene Ring Embedded in P-Type Network

Theorem 1. Consider the graph of a benzene ring embedded in the P-type surface network \( BR(m, n) \) with \( m, n > 1 \), and then the M-polynomial of this graph is given by

\[
M(BR(m, n); x, y) = (4m + 4n)x^2y^2 + (16mn)x^3y^3 + (16mn - 6m - 6n)x^3y^3.
\]  

Table 3: Edge partition of the benzene ring embedded in the P-type surface network based on degrees of end vertices of each edge.

<table>
<thead>
<tr>
<th>( (d_u, d_v) )</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2, 2)</td>
<td>16mn</td>
</tr>
<tr>
<td>(2, 3)</td>
<td>16mn - 6m - 6n</td>
</tr>
</tbody>
</table>

Proof. Let the graph of a benzene ring embedded in the P-type surface network with \( m \) and \( n \) being the number of unit cells in the columns and rows, respectively. It consists of two vertices and three edge partitions. From Figure 1, it is easy to observe that

\[
|V(BR(m, n))| = 24mn,
\]

\[
|E(BR(m, n))| = 32mn - 2m - 2n.
\]  

From Table 2, it can be seen that there are two partitions of the vertex set of the benzene ring embedded in the P-type surface network.

\[
V_1(BR(m, n)) = \{ u \in V(BR(m, n)) | d_u = 2 \},
\]

\[
V_2(BR(m, n)) = \{ u \in V(BR(m, n)) | d_u = 3 \},
\]

such that

\[
|V_1(BR(m, n))| = 8mn + 4m + 4n,
\]

\[
|V_2(BR(m, n))| = 16mn - 4m - 4n.
\]  

From Table 3, it can be seen that there are three partitions of the edge set of the benzene ring embedded in the P-type surface network.

\[
E_1(BR(m, n)) = \{ uv \in E(G) | d_u = 2, d_v = 2 \},
\]

\[
E_2(BR(m, n)) = \{ uv \in E(G) | d_u = 2, d_v = 3 \},
\]

\[
E_3(BR(m, n)) = \{ uv \in E(G) | d_u = 3, d_v = 3 \},
\]

such that

\[
|E_1(BR(m, n))| = 4m + 4n,
\]

\[
|E_2(BR(m, n))| = 16mn,
\]

\[
|E_3(BR(m, n))| = 16mn - 6m - 6n.
\]  

Now, applying the definition of M-polynomial to the graph of the benzene ring embedded in the P-type network, we have

\[
M(BR(m, n); x, y) = \sum_{i,j} m_{ij} x^i y^j
\]

\[
= \sum_{i,j} m_{ij} x^i y^j
\]

\[
= \sum_{uv \in E_1(G)} m_{22} x^2 y^2 + \sum_{uv \in E_2(G)} m_{23} x^2 y^3
\]

\[
+ \sum_{uv \in E_3(G)} m_{33} x^3 y^3
\]

\[
= |E_1(G)| x^2 y^2 + |E_2(G)| x^2 y^3
\]

\[
+ |E_3(G)| x^3 y^3,
\]

\[
M(BR(m, n); x, y) = (4m + 4n)x^2y^2 + (16mn)x^3y^3
\]

\[
+ (16mn - 6m - 6n)x^3y^3.
\]
The 3D graphical representation of M-polynomial of the benzene ring embedded in the P-type surface network BR \((m, n)\) is depicted in Figure 2. This is plotted by using Maple 13. The graph shows different behavior by fixing the values of \(m\) and \(n\) and changing the parameters \(x\) and \(y\). If the 2D graphical representation of M-polynomial of BR \((m, n)\) can be formed by considering the parameter \(x\) to be the positive value, then the graph increases by increasing the values of \(x\), and the graph lies in the first and third quadrant. The same behavior occurs for positive values of \(y\), as depicted in Figures 3(a) and 3(b). If the parameter \(x\) is taken to be the negative value, then the graph increases by increasing the values of \(x\), and the graph lies in the second and fourth quadrant. The same behavior occurs for negative values of \(y\).

4. Topological Indices Derived from M-Polynomial of BR \((m, n)\)

The following proposition computes the degree-based topological indices that are derived from the M-polynomial of the molecular graph of the benzene ring embedded in the P-type surface network.

**Proposition 1.** Consider the graph \(G\) be a benzene ring embedded in the P-type surface network with \(m, n > 1\); then, we have the following degree-based topological indices:

1. \(M_1(G) = 176mn - 20m - 20n\)
2. \(M_2(G) = 240mn - 38m - 38n\)
3. \(mM_2(G) = (40mn + 3m + 3n)/9\)
4. \(SDD(G) = (200mn - 12m - 12n)/3\)
5. \(H(G) = 176mn/15\)
6. \(I(G) = (24mn - 25m - 25n)/5\)
7. \(A(G) = (9928mn - 1163m - 1163n)/32\)
8. \(RR_x(G) = (16mn)((2a^2 + 3a)/(2a^2 + 3a)) + (m + n)((4(2a^2 - 6(2a^2))/6(2a^2))\)
9. \(R_y(G) = (16mn)(3a^2 + 6a) + (m + n)(4(2a^2 - 6(2a^2))/6(3a^2))\)

**Proof.** Consider the molecular graph of \(G\) be a benzene ring embedded in the P-type surface network with \(m, n > 1\); its M-polynomial is simplified in the first theorem. Now, consider the following:

\[
D_x(f(x, y)) = 2(4m + 4n)x^2y^2 + 2(16mn)x^2y^3 + 3(16mn - 6m - 6n)x^3y^3, \quad (19)
\]

\[
D_y(f(x, y)) = 2(4m + 4n)x^2y^2 + 3(16mn)x^2y^3 + 3(16mn - 6m - 6n)x^3y^3, \quad (20)
\]

\[
D_xD_y(f(x, y)) = 4(4m + 4n)x^2y^2 + 6(16mn)x^2y^3 + 9(16mn - 6m - 6n)x^3y^3, \quad (21)
\]

\[
S_x(f(x, y)) = \frac{(4m + 4n)}{2}x^2y^2 + \frac{(16mn)}{2}x^2y^3 + \frac{(16mn - 6m - 6n)}{3}x^3y^3, \quad (22)
\]

In order to prove the above nine results, we use the following formulas:

\[
Q_a(f(x, y)) = x^a f(x, y),
\]

\[
f(x, y) = (4m + 4n)x^2y^2 + (16mn)x^2y^3 + (16mn - 6m - 6n)x^3y^3.
\]

Now, we have the following computations:
Now, by using all the aforementioned values from equations (19)–(30) in Table 1, the topological indices defined in Table 1 are obtained.

(1) $M_1(G) = 176mn - 20m - 20n$
(2) $M_2(G) = 240mn - 38m - 38n$
(3) $mM_2(G) = (40mn + 3m + 3n)/9$
(4) $SDD(G) = (200mn - 12m - 12n)/3$
(5) $H(G) = 176mn/15$
(6) $I(G) = (24mn - 25m - 25n)/5$
(7) $A(G) = (9928mn - 1163m - 1163n)/32$

(8) $RR_{a}(G) = (16mn)((2^a + 3^a)/2^a 3^{2a}) + (m + n)$

(9) $R_{a}(G) = (16mn)(3^{2a} + 6^a) + (m + n)(4(2^{2a}) - 6(3^{2a}))$

The symmetric division, harmonic, inverse sum, and augmented Zagreb indices are plotted by using Maple 13. The graphical representation depicts different behavior of indices by changing the parameters $m$ and $n$. The blue, green, red, and black colors show the symmetric division, harmonic, inverse sum, and augmented Zagreb indices, respectively, as depicted in Figure 4(a). Figure 4(b) illustrates
Figure 4: (a) Plot of symmetric division, harmonic, inverse sum, and augmented Zagreb index for fix $n$ parameter. (b) Plot of first Zagreb, second Zagreb, and modified Zagreb index for fix $m$ parameter.

Figure 5: The 3D plot of Randić index for $BR(m,n)$.

Figure 6: The 3D plot of the inverse Randić index for $BR(m,n)$.
the first Zagreb index in blue color, second Zagreb index in green color, and modified Zagreb index in red color.

The 3D plot of the Randić index and inverse Randić index is illustrated in Figures 5 and 6, respectively. It is clearly seen from the graphs that by increasing the values of the parameters $m$ and $n$, the graph of 5 increases faster than the graph of 6. It can be concluded that the Randić index increases faster than the inverse Randić index.

The 2D plot of the inverse Randić index is depicted in Figure 7(a). It is achieved by using Maple 13 and fixing the value of the parameter $m$ or $n$. In both cases, if values of the parameter increases then the graph increases gradually and shows different behavior. The 2D plot of the Randić index is depicted in Figure 7(b). By increasing the values of the parameters, the graph increases and depicts different behavior.

Figure 8 illustrates the 3D plot of the augmented Zagreb index for the molecular graph $BR(m, n)$. By increasing the values of the given parameters, the value of indices increases. The value indices of $BR(m, n)$ increase by changing the values of parameters $m$ and $n$. The indices derived here are the functions that depend on the values of parameters, where $m$ and $n$ are the independent parameters and the index is the dependent parameter.

5. Conclusions

We have computed the general form of M-polynomial for the molecular graph of the benzene ring embedded in the P-type surface network $BR(m, n)$ for the first time. The graphical representation of M-polynomial of $BR(m, n)$ and some of its indices have plotted for different values of the given parameters. Furthermore, we have derived and simplified the exact results for degree-based topological indices of $BR(m, n)$ from the M-polynomial of $BR(m, n)$.

In future, we will sketch and design some new chemical graphs/networks and compute their M-polynomial and examine their underlying topological properties.
