We analyze the generalized analytic function space Feynman integral and then defined a modified generalized analytic function space Feynman integral to explain the physical circumstances. Integration formulas involving the modified generalized analytic function space Feynman integral are established which can be applied to several classes of functionals.

1. Introduction

Let \( C_0[0, T] \) denote the one-parameter Wiener space, that is, the space of continuous real-valued functions \( x \) on \([0, T]\) with \( x(0) = 0 \), and let \( m \) denote Wiener measure. Since the concept of the Feynman integral was introduced by Feynman and Kac, many mathematicians studied the “analytic” Feynman integral of functionals in several classes of functionals [1–7]. Recently the authors have introduced an approach to the solutions of the diffusion equation and the Schrödinger equation via the Fourier-type functionals on Wiener space [6].

The function space \( C_{a,b}[0,T] \), induced by a generalized Brownian motion, was introduced by Yeh in [8] and studied extensively in [9–11]. In [II] the authors have studied the generalized analytic Feynman integral for functionals in a very general function space \( C_{a,b}[0,T] \).

In this paper, we present an analysis of the generalized analytic Feynman integral on function space. We define a modified generalized analytic function space Feynman integral (AFSFI) and then explain the physical circumstances with respect to an anharmonic oscillator using the concept of the modified generalized analytic Feynman integral on function space.

The Wiener process used in [1–7] is stationary in time and is free of drift while the stochastic process used in this paper, as well as in [9–12], is nonstationary in time, is subject to a drift \( a(t) \), and can be used to explain the position of the Ornstein-Uhlenbeck process in an external force field [13].

2. Preliminaries

Let \( a(t) \) be an absolutely continuous real-valued function on \([0, T]\) with \( a(0) = 0 \), \( a'(t) \in L^2[0, T] \), and let \( b(t) \) be a strictly increasing, continuously differentiable real-valued function with \( b(0) = 0 \) and \( b'(t) > 0 \) for each \( t \in [0, T] \). The generalized Brownian motion process \( Y \) determined by \( a(t) \) and \( b(t) \) is a Gaussian process with mean function \( a(t) \) and covariance function \( r(s,t) = \min\{b(s), b(t)\} \). By Theorem 14.2 in [14], the probability measure \( \mu \) induced by \( Y \), taking a separable version, is supported by \( C_{a,b}[0,T] \) (which is equivalent to the Banach space of continuous functions \( x \) on \([0, T]\) with \( x(0) = 0 \) under the sup norm). Hence, \( (C_{a,b}, [0, T], \mathcal{B}(C_{a,b}[0, T]), \mu) \) is the function space induced by \( Y \) where \( \mathcal{B}(C_{a,b}[0, T]) \) is the Borel \( \sigma \)-algebra of \( C_{a,b}[0,T] \). We then complete this function space to obtain \( (C_{a,b}[0,T], \mathcal{W}(C_{a,b}[0,T]), \mu) \) where \( \mathcal{W}(C_{a,b}[0,T]) \) is the set of all Wiener measurable subsets of \( C_{a,b}[0,T] \).

A subset \( A \) of \( C_{a,b}[0,T] \) is said to be scale-invariant measurable provided \( \rho A \in \mathcal{W}(C_{a,b}[0,T]) \) for all \( \rho > 0 \), and a scale-invariant measurable set \( N \) is said to be a scale-invariant
null set provided \( \mu(\rho N) = 0 \) for all \( \rho > 0 \). A property that holds except on a scale-invariant null set is said to hold scale-invariant almost everywhere (s-a.e.) [15].

Let \( L^2_{\text{ab}}[0,T] \) be the Hilbert space of functions on \([0,T]\) which are Lebesgue measurable and square integrable with respect to the Lebesgue-Stieltjes measures on \([0,T]\) induced by \( a(\cdot) \) and \( b(\cdot) \); that is,

\[
L^2_{\text{ab}}[0,T] = \left\{ v : \int_0^T v^2(s) \, db(s) < \infty, \quad \int_0^T v^2(s) \, d|a|(s) < \infty \right\},
\]

where \( |a|(t) \) denotes the total variation of the function \( a \) on the interval \([0,t]\).

For \( u, v \in L^2_{\text{ab}}[0,T] \), let

\[
(u, v)_{\text{ab}} = \int_0^T u(t) v(t) \, d[b(t) + |a|(t)].
\]

Then \((\cdot, \cdot)_{\text{ab}}\) is an inner product on \( L^2_{\text{ab}}[0,T] \) and \( \|u\|_{\text{ab}} = \sqrt{(u,u)_{\text{ab}}} \) is a norm on \( L^2_{\text{ab}}[0,T] \). In particular note that \( \|a\|_{\text{ab}} = 0 \) if and only if \( u(t) = 0 \) a.e. on \([0,T]\). Furthermore \( (L^2_{\text{ab}}[0,T], \|\cdot\|_{\text{ab}}) \) is a separable Hilbert space. Note that all functions of bounded variation on \([0,T]\) are elements of \( L^2_{\text{ab}}[0,T] \). Also note that if \( a(t) = 0 \) and \( b(t) = t \), then \( L^2_{\text{ab}}[0,T] = L^2[0,T] \). In fact,

\[
\left( L^2_{\text{ab}}[0,T], \|\cdot\|_{\text{ab}} \right) \subset \left( L^2[0,T], \|\cdot\|_2 \right)
\]

since the two norms \( \| \cdot \|_{0,h} \) and \( \| \cdot \|_2 \) are equivalent.

For \( v \in L^2_{\text{ab}}[0,T] \) and \( x \in C_{\text{ab}}[0,T] \) we let

\[
\langle v, x \rangle = \int_0^T v(t) \, dx(t)
\]

denote the Paley-Wiener-Zygmund (PWZ) stochastic integral. Following are some facts about the PWZ stochastic integral [10–12].

1. The PWZ stochastic integral \( \langle v, x \rangle \) is essentially independent of the complete orthonormal set \( \{\phi_j^{\text{PWZ}}\}_{j=1}^{\infty} \).

2. If \( v \) is of bounded variation on \([0,T]\), then the PWZ stochastic integral \( \langle v, x \rangle \) equals the Riemann-Stieltjes integral \( \int_0^T v(t) \, dx(t) \) for s-a.e. \( x \in C_{\text{ab}}[0,T] \).

3. The PWZ integral has the expected linearity properties.

4. For all \( v \in L^2_{\text{ab}}[0,T], \langle v, x \rangle \) is a Gaussian random variable with mean \( \int_0^T v(s) \, da(s) \) and variance \( \int_0^T v^2(s) \, db(s) \).

Throughout this paper we will assume that each functional \( F : C_{\text{ab}}[0,T] \rightarrow \mathbb{C} \) we consider is scale-invariant measurable and that

\[
\int_{C_{\text{ab}}[0,T]} |F(\rho x)| \, d\mu(x) < \infty
\]

for each \( \rho > 0 \).

We finish this section by stating the notion of generalized analytic function space Feynman integral, cf. [10, 11].

**Definition 1.** Let \( \mathbb{C} \) denote the complex numbers, let \( \mathbb{C}_+ = \{ \lambda \in \mathbb{C} : \text{Re}(\lambda) > 0 \} \), and let \( \overline{\mathbb{C}}_+ = \{ \lambda \in \mathbb{C} : \lambda \neq 0 \text{ and } \text{Re}(\lambda) \geq 0 \} \). Let \( F : C_{\text{ab}}[0,T] \rightarrow \mathbb{C} \) be a measurable functional such that, for each \( \lambda > 0 \), the function space integral

\[
J(\lambda) = \int_{C_{\text{ab}}[0,T]} F(\lambda^{-1/2} x) \, d\mu(x)
\]

exists. If there exists a function \( J^*(\lambda) \) analytic in \( \mathbb{C}_+ \), such that \( J^*(\lambda) = J(\lambda) \) for all \( \lambda > 0 \), then \( J^*(\lambda) \) is defined to be the analytic function space integral of \( F \) over \( C_{\text{ab}}[0,T] \) with parameter \( \lambda \), and for \( \lambda \in \mathbb{C}_+ \) we write

\[
J^*(\lambda) = \int_{C_{\text{ab}}[0,T]} F(x) \, d\mu(x).
\]

Let \( q \neq 0 \) be a real number and let \( F \) be a functional such that \( J^*(\lambda) \) exists for all \( \lambda \in \mathbb{C}_+ \). If the following limit exists, we call it the generalized AF-SFI of \( F \) with parameter \( q \) and we write

\[
\int_{C_{\text{ab}}[0,T]} F(x) \, d\mu(x) = \lim_{\lambda \rightarrow -iq} \int_{C_{\text{ab}}[0,T]} F(x) \, d\mu(x),
\]

where \( \lambda \rightarrow -iq \) through values in \( \mathbb{C}_+ \).

### 3. Analogue of the Generalized AF-SFI

The differential equation

\[
\frac{\partial}{\partial t} \psi(u,t) = \frac{1}{2\lambda} \Delta \psi(u,t) - V(u) \psi(u,t)
\]

is called the diffusion equation with initial condition \( \psi(u,0) = \varphi(u) \), where \( \Delta \) is the Laplacian and \( V \) is an appropriate potential function. Many mathematicians have considered the Wiener integral of functionals of the form

\[
F(\lambda^{-1/2} x + u),
\]

where \( u \) is a real number. It is a well-known fact that the Wiener integral of the functional having the form

\[
\exp \left\{ -\int_0^T V(\lambda^{-1/2} x(t) + u) \, dt \right\} \varphi(\lambda^{-1/2} x(T) + u)
\]

forms the solution of the diffusion equation (9) by the Feynman-Kac formula. If time is replaced by an imaginary time, this diffusion equation becomes the Schrödinger equation

\[
i \frac{\partial}{\partial t} \psi(u,t) = -\frac{1}{2} \Delta \psi(u,t) + V(u) \psi(u,t)
\]
with the initial condition $\psi(u,0) = \phi(u)$. Hence the solution to the Schrödinger equation (12) can be obtained via the analytic Feynman integral. An approach to finding the solution to the diffusion equation (9) and the Schrödinger equation (12) involves the harmonic oscillator $V(u) = (k/2)u^2$; for a more detailed study, see [6]. However, it can be difficult to obtain the solution for the diffusion equation (9) and the Schrödinger equation (12) with respect to anharmonic oscillators.

In this paper, we consider the following functional:

$$
\exp \left\{ - \int_0^T V \left( \lambda^{-1/2} x(t) + c(\lambda) h(t) \right) dt \right\}
\times \varphi \left( \lambda^{-1/2} x(T) + c(\lambda) h(T) \right),
$$  

(13)

where $c(\lambda)$ is a real number with respect to $\lambda$ and $h(t)$ is a real-valued function on $[0, T]$. When $h(t) = u$ for all $t \in [0, T]$ and $c(\lambda)$ is independent of the value $\lambda$, the functional in (13) reduces the functional in (11). That is to say, our functional (13) is more generalized compared with the functional in (11). Hence, all results and formulas for the functional in (11) are special cases of our results and formulas.

We will now explain the importance of the functionals given by (13). For a positive real number $k$, when the potential function is $V(u) = (k/2)u^2$, the diffusion equation (9) is called the diffusion equation for a harmonic oscillator with $V$. For $\xi \in \mathbb{R}$,

$$
V_1(u) \equiv V(u + \xi) = \frac{k}{2}(u + \xi)^2
$$  

(14)

is just the translation of $V$; thus, it is called the diffusion equation for a harmonic oscillator with $V_1$. However, for an appropriate function $h(t)$ on $[0, T]$,

$$
V_2(u) \equiv V(u + h(u)) = \frac{k}{2}(u + h(u))^2
$$  

(15)

may be an anharmonic oscillator. For example, consider the following:

(1) If $h(t) = u^2$ on $[0, T]$, then

$$
V_3(u) = \frac{k}{2} \left( u^2 + 2u^3 + u^4 \right).
$$  

(16)

In this case, the diffusion equation (9) is called the diffusion equation for anharmonic oscillator with $V_3$ because it contains the “$u^3$-term.” This means that the status of the harmonic oscillator can be exchanged for the status of the anharmonic oscillator under certain physical circumstances. We can explain this phenomenon by considering the Wiener integral of the functional in (13).

(2) For a real number $y$, if $h(t) = -u + \sqrt{u^2(u^2 - y^2)}$ on $[0, T]$, then

$$
V_4(u) = \frac{k}{2} u^2 \left( u^2 - y^2 \right).
$$  

(17)

In this case, the diffusion equation (9) is called the diffusion equation for double-well potential with $V_4$. As such, it is a harmonic oscillator.

Furthermore, we see that, for $v \in L^2_{a,b}[0,T], h \in \mathcal{C}_{a,b}[0,T]$, and $u \in \mathbb{R}$,

$$
\langle v, x + u \rangle = \langle v, x \rangle + \langle v, h \rangle
$$  

(18)

provided $\langle v, h \rangle \neq 0$. Thus, the functionals presented in this paper are more meaningful than the functionals given in previous papers [6, 11]. This also has implications regarding the generalizations of our research observations.

We are now ready to state the definition of the modified generalized AFSFI.

**Definition 2.** Let $h \in \mathcal{C}_{a,b}[0,T]$ be given. Let $F : \mathcal{C}_{a,b}[0,T] \rightarrow \mathbb{C}$ be such that, for each $\lambda > 0$, the function space integral

$$
J(\lambda) = \int_{C_{a,b}[0,T]} F \left( \lambda^{-1/2} x + c(\lambda) h \right) d\mu(x)
$$  

(19)

exists for all $\lambda > 0$ where $c(\lambda)$ is a nonnegative real number which depends on $\lambda$. If there exists a function $J^*(\lambda)$ analytic in $\mathcal{C}_+$ such that $J^*(\lambda) = J(\lambda)$ for all $\lambda > 0$, then $J^*(\lambda)$ is defined to be the modified analytic function space integral of $F$ over $\mathcal{C}_{a,b}[0,T]$ with parameter $\lambda$, and for $\lambda \in \mathcal{C}_+$ we write

$$
J^*(\lambda) = \int_{C_{a,b}[0,T]} F(x) d\mu(x).
$$  

(20)

Let $q \neq 0$ be a real number and let $F$ be a functional such that $\int_{C_{a,b}[0,T]} F(x) d\mu(x)$ exists for all $\lambda \in \mathcal{C}_+$. If the following limit exists, we call it the modified generalized AFSFI of $F$ with parameter $q$ and we write

$$
\int_{C_{a,b}[0,T]} F(x) d\mu(x) = \lim_{\lambda \rightarrow -iq} \int_{C_{a,b}[0,T]} F(x) d\mu(x),
$$  

(21)

where $\lambda$ approaches $-iq$ through values in $\mathcal{C}_+$.

**Remark 3.** We have the following assertions with respect to the modified generalized AFSFI.

(1) If $h(t) \equiv 0$ on $[0,T]$ or $c(\lambda) = 0$, then we can write

$$
\int_{C_{a,b}[0,T]} F(x) d\mu(x) = \lim_{\lambda \rightarrow \infty} \int_{C_{a,b}[0,T]} F(x) d\mu(x),
$$  

(22)

(2) In the setting of classical Wiener space (in our research, when $a(t) \equiv 0$ and $b(t) = t$ on $[0,T]$), our modified generalized AFSFI, the generalized AFSFI, and the analytic Feynman integral coincide. Hence all results and formulas in [2, 3, 5, 6, 16] are corollaries of our results and formulas in this paper.

We conclude this section by listing several integration formulas for simple functionals to compare with the generalized AFSFI and the modified generalized AFSFI. For all nonzero real number $q$, we have Tables 1 and 2.
4. Some Properties for the Modified Generalized AFSFI

In this section we establish a Fubini theorem for the modified analytic function space integrals and the modified generalized AFSFs for functionals on $C_{ah}[0, T]$. We also use these Fubini theorems to establish various modified generalized analytic Feynman integration formulas.

First, we define a function to simply express many results and formulas in this paper. For $n \geq 2$, define a function $H_n : \mathbb{C}_+^n \to \mathbb{C}_+$ by

$$H_n(z_1, \ldots, z_n) = \sum_{j=1}^{n} z_j^{1/2} - \left( \sum_{j=1}^{n} z_j^{-1} \right)^{1/2}, \quad (23)$$

where $\sum_{j=1}^{n} z_j^{-1} \neq 0$ and $\sum_{j=1}^{n} z_j^{-1} \neq 0$. Note that $H_n$ is a symmetric function for all $n = 2, 3, \ldots$. In this paper we will assume that, for all $(z_1, \ldots, z_n) \in \mathbb{C}_+^n$ and $(\sum_{j=1}^{n} z_j^{-1})^{1/2}$, $n = 1, 2, \ldots$, and $z_j^{1/2}$, $j = 1, 2, \ldots, n$, are always chosen to have positive real parts.

In our first theorem, we show that the modified generalized AFSFs are commutative.

**Theorem 4.** Let $h_1$ and $h_2$ be elements of $C_{ah}[0, T]$ and let $F$ be a functional defined on $C_{ah}[0, T]$ such that

$$\int_{C_{ah}[0, T]} |F(yx + \beta y + c(y)h_1 + c(\beta)h_2)| \times d(\mu \times \mu)(x, y) < \infty, \quad (24)$$

for all nonzero real numbers $\gamma$ and $\beta$. Then for all $q_1, q_2 \in \mathbb{R} - \{0\},$

$$\int_{C_{ah}[0, T]} \left( \int_{C_{ah}[0, T]} F(x + y) d\mu(x) \right) d\mu(y)$$

$$\leq \int_{C_{ah}[0, T]} \left( \int_{C_{ah}[0, T]} F(x + y) d\mu(y) \right) d\mu(x), \quad (25)$$

where $\leq$ means that if either side exists, both sides exist and equality holds.

**Proof.** First, using the symmetric property, for all $\lambda, \beta > 0,$

$$\int_{C_{ah}[0, T]} F\left( \lambda^{-1/2} x + \beta^{-1/2} y + c(\lambda) h_1 \right)$$

$$+ c\left(\beta\right) h_2) d(\mu \times \mu)(x, y)$$

$$= \int_{C_{ah}[0, T]} F\left( \lambda^{-1/2} y + \lambda^{1/2} x + c(\beta) h_2 \right)$$

$$+ c(\lambda) h_1) d(\mu \times \mu)(y, x).$$

This can be analytically continued in $\lambda$ and $\beta$ for $(\lambda, \beta)$ and so we have, for all $(\lambda, \beta) \in \mathbb{C}_+ \times \mathbb{C}_+$,

$$\int_{C_{ah}[0, T]} \left( \int_{C_{ah}[0, T]} F(x + y) d\mu(x) \right) d\mu(y)$$

$$\leq \int_{C_{ah}[0, T]} \left( \int_{C_{ah}[0, T]} F(x + y) d\mu(y) \right) d\mu(x). \quad (27)$$

Next, let $E$ be a subset of $\mathbb{C}_+ \times \mathbb{C}_+$ containing the point $(-iq_1, -iq_2)$ and it is such that $(\lambda, \beta) \in E$ implies that $\lambda + \beta \neq 0$. Note that the function

$$\mathcal{H}(\lambda, \beta) \equiv \int_{C_{ah}[0, T]} \left( \int_{C_{ah}[0, T]} F(y + z) d\mu(y) \right) d\mu(z). \quad (28)$$

is continuous on $E$ and is uniformly continuous on $E$ provided $E$ is compact. Then by the continuity of $\mathcal{H}$ and (27), we can establish (25) as desired. \qed

The following theorem was established in [12, 17]. Formula (29) is called the Fubini theorem with respect to the function space integrals.

**Theorem 5.** Let $F$ be as in Theorem 4 above. Then

$$\int_{C_{ah}[0, T]} F(yx + \beta y) d(\mu \times \mu)(x, y)$$

$$= \int_{C_{ah}[0, T]} F\left( \sqrt{y^2 + \beta^2} z \right)$$

$$+ \left( y + \beta - \sqrt{y^2 + \beta^2} a \right) d\mu(z)$$

$$= \int_{C_{ah}[0, T]} F\left( \sqrt{y^2 + \beta^2} z + H_2(y^2, \beta^2) a \right) d\mu(z). \quad (29)$$
To establish Theorem 7, we need the following lemma.

**Lemma 6.** Let $F$ be as in Theorem 4 above. Then for all $(\lambda, \beta) \in C_+ \times C_+$ with $\lambda + \beta \neq 0$,

\[
\int_{C_{a,b}[0,T]}^{anf_{\alpha}} \left( \int_{C_{a,b}[0,T]}^{anf_{t}} F(x + y) \, d\mu(x) \right) \, d\mu(y) 
\]

\[
= \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z) \tag{30} \]

where $\gamma = \lambda \beta/(\lambda + \beta)$ and $c(\gamma) = H_2(\lambda, \beta)$.

**Proof.** Using (29), it follows that for $\lambda > 0$ and $\beta > 0$

\[
\int_{C_{a,b}[0,T]}^{anf_{\alpha}} F \left( \lambda^{-1/2} x + \beta^{-1/2} y \right) \, d(\mu \times \mu)(x, y) \]

\[
= \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F \left( \sqrt{\lambda^{-1} + \beta^{-1}} z + H_2(\lambda, \beta) \, a \right) \, d\mu(z). \tag{31} \]

This last expression is defined for $\lambda > 0$ and $\beta > 0$. For $\beta > 0$, it can be analytically continued in $\lambda \in C_+$. Also for $\lambda > 0$, it can be analytically continued in $\beta \in C_+$. Therefore since $\lambda \in C_+$ and $\beta \in C_+$ implies that $\lambda \beta/(\lambda + \beta) \in C_+$, we conclude that the last expression in proof of Lemma 6 can be analytically continued into $C_+$ to equal the analytic function space integral

\[
\int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z), \tag{32} \]

which completes the proof of Lemma 6 as desired. \(\square\)

The following theorem is the main result with respect to the modified generalized AFSFI.

**Theorem 7.** Let $F$ be as in Lemma 6 above. Then for all $q_1, q_2 \in \mathbb{R} - \{0\}$ with $q_1 + q_2 \neq 0$,

\[
\int_{C_{a,b}[0,T]}^{anf_{\alpha}} \left( \int_{C_{a,b}[0,T]}^{anf_{t}} F(x + y) \, d\mu(x) \right) \, d\mu(y) 
\]

\[
= \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z) \tag{33} \]

where $q_3 = q_1 q_2/(q_1 + q_2)$ and $c(q_3) = H_2(-iq_1, -iq_2)$.

**Proof.** First note that, for all $q_1, q_2 \in \mathbb{R} - \{0\}$ with $q_1 + q_2 \neq 0$, if $\lambda \to -iq_1$ and $\beta \to -iq_2$, then $\lambda \beta/(\lambda + \beta) \to -i(q_1 q_2/(q_1 + q_2))$. Now using this fact and (30) it follows that

\[
\int_{C_{a,b}[0,T]}^{anf_{\alpha}} \left( \int_{C_{a,b}[0,T]}^{anf_{t}} F(x + y) \, d\mu(x) \right) \, d\mu(y) 
\]

\[
= \lim_{\beta \to -iq_2} \lim_{\lambda \to -iq_1} \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z) \tag{34} \]

\[
= \lim_{\lambda \beta/(\lambda + \beta) \to -iq_2} \lim_{\lambda \to -iq_1} \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z) 
\]

\[
= \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z), \tag{35} \]

where $\gamma$ and $c(\gamma)$ are as in Lemma 6. Hence we complete the proof as desired. \(\square\)

Equations (35)–(37) below follow by mathematical induction and Theorem 7 above.

**Corollary 8.** Let $F$ be as in Theorem 7 above. Then one has the following assertions.

(1) For all $q \in \mathbb{R} - \{0\}$,

\[
\int_{C_{a,b}[0,T]}^{anf_{\alpha}} \left( \int_{C_{a,b}[0,T]}^{anf_{t}} F(x + y) \, d\mu(x) \right) \, d\mu(y) 
\]

\[
= \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z), \tag{36} \]

where $c(q) = H_2(-iq, -iq)$.

(2) For all $q_1, \ldots, q_n \in \mathbb{R} - \{0\}$ with $\sum_{j=1}^{k}(q_1 \ldots q_k/q_j) \neq 0$ for $k = 2, \ldots, n$,

\[
\int_{C_{a,b}[0,T]}^{anf_{\alpha}} \ldots \int_{C_{a,b}[0,T]}^{anf_{t}} F(x_1 + \ldots + x_n) \, d(\mu \times \cdots \times \mu)(\vec{x}) 
\]

\[
= \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z), \tag{37} \]

\[
\text{where } \vec{x} = (x_1, \ldots, x_n), \beta_n = q_1 \ldots q_{n-1}/\sum_{j=1}^{n}(q_1 \ldots q_n/q_j), \text{ and } c(\beta_n) = H_2(-iq_1, \ldots, -iq_n). \]

Furthermore,

\[
\int_{C_{a,b}[0,T]}^{anf_{\alpha}} \ldots \int_{C_{a,b}[0,T]}^{anf_{t}} F(x_1 + \ldots + x_n) \, d(\mu \times \cdots \times \mu)(\vec{x}) 
\]

\[
= \int_{C_{a,b}[0,T]}^{anf_{\alpha}} F(z) \, d\mu(z), \tag{38} \]

where $c(q/n) = H_2(-iq, \ldots, -iq)$.

Next we establish some integration formulas with respect to the modified generalized AFSFIs.

(1) A formula showing that the double modified generalized AFSFIs can be expressed by just one modified
generalized AFSFI. For all $q_1, q_2 \in \mathbb{R} - \{0\}$ with $q_1 + q_2 \neq 0$,
\begin{align}
\int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} \int_{C_{ab}[0,T]} F(x + y) d\mu(x) \right) d\mu(y) & \\
= \int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} F(z) d\mu(z) ,
\end{align}
where $c(q_1, q_2) = H_2(-iq_1, -iq_2) + c(q_1) + c(q_2)$. Furthermore, if $c(q_1) + c(q_2) = -H_2(-iq_1, -iq_2)$, then
\begin{align}
\int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} F(x + y) d\mu(x) \right) d\mu(y) & \\
= \int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} F(z) d\mu(z) ,
\end{align}
where $q_1 = q_1 q_2/(q_1 + q_2)$ and $c(q_1) = H_2(-iq_1, -iq_2) + c(q_1)$.

(2) A relationship between the modified generalized AFSFI and the generalized AFSFI. For all $q_1, q_2 \in \mathbb{R} - \{0\}$ with $q_1 + q_2 \neq 0$,
\begin{align}
\int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} F(x + y) d\mu(x) \right) d\mu(y) & \\
= \int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} F(z) d\mu(z) ,
\end{align}
where $F \in \mathcal{S}\left(L^2_{ab}[0,T]\right)$ is given by (42) above. Suppose that corresponding measure $f$ of $F$ satisfies the condition
\begin{align}
\int_{C_{ab}[0,T]} \exp \left[ \frac{4}{\sqrt{2|q_0|}} \right] v(s) d|a|(s) \right) df(v) & < \infty.
\end{align}

Example 1. Let $q_0$ be a fixed nonzero real number. Let $F \in \mathcal{S}\left(L^2_{ab}[0,T]\right)$ be given by (42) above. Suppose that corresponding measure $f$ of $F$ satisfies the condition
\begin{align}
\int_{C_{ab}[0,T]} \exp \left[ \frac{4}{\sqrt{2|q_0|}} \right] v(s) d|a|(s) \right) df(v) & < \infty.
\end{align}

Then for all nonzero real number $q$ with $|q| > |q_0|$,
\begin{align}
\int_{C_{ab}[0,T]} F(x) d\mu(x) & \\
= \int_{C_{ab}[0,T]} \exp \left[-\frac{i}{2q} \left( v^2, b' \right) \right] d\mu(v) ,
\end{align}
where
\begin{align}
\left( v, a' \right) = \int_0^T v(t) ds(t), \quad \left( v^2, b' \right) = \int_0^T v^2(t) db(t).
\end{align}

Next, using Theorem 7, we can compute the double generalized AFSFIs of $F \in \mathcal{S}\left(L^2_{ab}[0,T]\right)$ by just one modified generalized AFSFI. That is to say, for all $q_1, q_2 \in \mathbb{R}$ with $|q_1| \geq |q_0|, |q_2| \geq |q_0|$ and $q_1 + q_2 \neq 0$,
\begin{align}
\int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} F(x + y) d\mu(x) \right) d\mu(y) & \\
= \int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} F(z) d\mu(z) ,
\end{align}
where $\gamma = q_1 q_2/(q_1 + q_2)$ and $c(\gamma) = H_2(-iq_1, -iq_2)$. Furthermore the last expression in (46) equals the expression
\begin{align}
\int_{C_{ab}[0,T]} \left( \frac{\alpha_n \gamma^a(\tau_1, \tau_2)}{C_{ab}[0,T]} F(x + y) d\mu(x) \right) d\mu(y) .
\end{align}

5. Examples

In this section, we provide several brief examples in which we apply our formulas and results.

5.1. Banach Algebra $\mathcal{S}\left(L^2_{ab}[0,T]\right)$. Let $M(\mathcal{C}_{ab}[0,T])$ be the space of complex-valued, countably additive Borel measures on $\mathcal{C}_{ab}[0,T]$. The Banach algebra $\mathcal{S}\left(L^2_{ab}[0,T]\right)$ consists of those functionals $F$ on $\mathcal{C}_{ab}[0,T]$ expressible in the form
\begin{align}
F(x) = \int_{L^2_{ab}[0,T]} \exp \left[i \langle v, x \rangle \right] df(v)
\end{align}
for s.a.e. $x \in \mathcal{C}_{ab}[0,T]$ where the associated measure $f$ is an element of $M(\mathcal{L}_{ab}[0,T])$.

5.2. The Fourier Transform of a Complex-Valued Measure. For given $\vec{m} = (m_1, \ldots, m_n) \in \mathbb{R}^n$ and $\vec{\sigma}^2 = (\sigma_1^2, \ldots, \sigma_n^2) \in \mathbb{R}^n$
with \( \sigma_j^2 > 0 \), \( j = 1, \ldots, n \), let \( \nu_{\sigma_j^2} \) be the Gaussian measure given by

\[
\nu_{\sigma_j^2}(B) = \left( \frac{2}{\pi \sigma_j^2} \right)^{-1/2} \int_B \exp \left\{ -\frac{1}{2} \sum_{j=1}^{n} \frac{(u_j - m_j)^2}{\sigma_j^2} \right\} \, du,
\]

(48)

where \( B \in \mathcal{B}(\mathbb{R}^n) \). Then \( \nu_{\sigma_j^2} \) is a complex-valued Borel measure on \( \mathbb{R}^n \) and

\[
\overline{\nu_{\sigma_j^2}}(\bar{u}) = \exp \left\{ -\frac{1}{2} \sum_{j=1}^{n} \sigma_j^2 u_j^2 + i \sum_{j=1}^{n} m_j u_j \right\},
\]

(49)

where \( \overline{\nu_{\sigma_j^2}} \) is the Fourier transform of the Gaussian measure \( \nu_{\sigma_j^2} \).

Example 2. Let \( \{\alpha_1, \ldots, \alpha_n\} \) be any orthonormal set in \( L^2_{a,b}[0,T] \) and let \( F: C_{a,b}[0,T] \to \mathbb{R}^n \) be the functional defined by

\[
F(x) = \nu_{\sigma_j^2} (\{\alpha_1, x\}, \ldots, \{\alpha_n, x\}),
\]

(50)

where \( \text{Var}(\{\alpha_j, x\})^2 = 1 \) for all \( j = 1, 2, \ldots, n \). Then for all nonzero real number \( q \),

\[
\int_{C_{a,b}[0,T]} F(x) \, d\mu(x)
\]

\[
= \left( \frac{1}{\sum_{j=1}^{n} \sigma_j^2 + 1} \right)^{1/2}
\]

\[
\times \exp \left\{ -\frac{1}{2} \sum_{j=1}^{n} (\sigma_j^2)^{-1/2} \right\}
\]

\[
\times \left\{ \sum_{j=1}^{n} (\alpha_j, h) + i c(q) \sum_{j=1}^{n} m_j (\alpha_j, h) \right\},
\]

(51)

where \( A_j = \int_0^T \alpha_j(t) \, da(t) \). Using Theorem 7, we can compute the double generalized AFSFIs of \( F \) given by (50) by just one modified generalized AFSFI. That is to say, for all \( q_1, q_2 \in \mathbb{R} \) with \( q_1 + q_2 \neq 0 \),

\[
\int_{C_{a,b}[0,T]} \left( \int_{C_{a,b}[0,T]} F(x + y) \, d\mu(x) \right) \, d\mu(y)
\]

\[
= \left( \prod_{j=1}^{n} \left( \frac{1}{2(1 - (iQ)^{-1/2} \sigma_j^2)} \right)^{1/2} \right)^{1/2}
\]

\[
\times \exp \left\{ -\frac{c(Q) \sum_{j=1}^{n} \sigma_j^2 (\alpha_j, h) + ic(Q) \sum_{j=1}^{n} m_j (\alpha_j, h)}{2} \right\},
\]

(52)

where \( Q = q_1 q_2/(q_1 + q_2) \) and \( c(Q) = H_2(-iq_1, -iq_2) \). Furthermore, the last expression in (52) equals the expression

\[
\int_{C_{a,b}[0,T]} \left( \int_{C_{a,b}[0,T]} F(x + y) \, d\mu(y) \right) \, d\mu(x).
\]

(53)

5.3. The Generalized Fourier-Hermite Functional on Function Space. For each \( m = 0, 1, 2, \ldots \), and for each \( j = 1, 2, \ldots \), let \( H_m^j(u) \) denote the generalized Hermite polynomial

\[
H_m^j(u) \equiv (-1)^m (mt)^{-1/2} (B_j)^{m/2} \exp \left\{ \frac{(u - A_j)^2}{B_j} \right\}
\]

\[
	imes \frac{d^m}{du^m} \left( \exp \left\{ -\frac{(u - A_j)^2}{B_j} \right\} \right).
\]

(54)

Then for each \( j = 1, 2, \ldots \), the set

\[
\{ (2\pi B_j)^{-1/4} H_m^j(u) | m = 0, 1, \ldots \}
\]

is a complete orthonormal set in \( L^2(\mathbb{R}) \). Now we define

\[
\Phi_{(m_1, \ldots, m_n)}(x) = \prod_{j=1}^{k} H_{m_j}^j \left( \left\langle \alpha_j, x \right\rangle \right).
\]

(56)

The functionals in (56) are called the generalized Fourier-Hermite functionals. It is known that these functionals form a complete orthonormal set in \( L^2(C_{a,b}[0,T]) \); that is to say, let \( F \in L^2(C_{a,b}[0,T]) \) and, for \( N = 1, 2, \ldots \), let

\[
F_N(x) = \sum_{m_1, \ldots, m_N=0}^{N} A_{m_1, \ldots, m_N}^F \Phi_{(m_1, \ldots, m_N)}(x),
\]

(57)
where $A^F_{(m_1,...,m_N)}$ is the generalized Fourier-Hermite coefficient,
\[
A^F_{(m_1,...,m_N)} = \int_{C_{ab}(0,T)} F(x) \Phi_{(m_1,...,m_N)}(x) \, d\mu(x).
\] (58)

Then
\[
F(x) = \lim_{N \to \infty} \sum_{m_1,...,m_N=0}^{N} A^F_{(m_1,...,m_N)} \Phi_{(m_1,...,m_N)}(x)
\] (59)
is called the generalized Fourier-Hermite series expansion of $F$. In (59), the limit is taken in the $L^2(C_{ab}[0,T])$-sense.

**Example 3.** Let $q_0$ be a nonzero real number and let $\Phi_{(m_1,...,m_N)}$ be the generalized Fourier-Hermite functional given by (56) above. Then for all nonzero real number $q$ with $|q| \geq |q_0|$, the modified generalized AFSFI of $\Phi_{(m_1,...,m_N)}$ exists and it is given by the formula
\[
\int_{C_{ab}[0,T]} \Phi_{(m_1,...,m_N)}(x) \, d\mu(x) = \prod_{j=1}^{N} \int_{C_{ab}[0,T]} \phi_{(m_j,j)}(x) \, d\mu(x),
\] (60)
where
\[
\phi_{(m_j,j)}(x) = H^j_m \left( \langle \alpha_j, x \rangle \right),
\]
\[
\int_{C_{ab}[0,T]} \phi_{(m_j,j)}(x) \, d\mu(x) = \left(2\pi B_j\right)^{-1/2} \int_{\mathbb{R}} H^j_m \left( (-iq)^{-1/2} u + c(q) \langle \alpha, h \rangle \right) \times \exp \left\{ -\left( \frac{u - A_j}{2B_j} \right)^2 \right\} \, du.
\] (61)
The last expression is valid because the generalized Hermite functional is a polynomial with degree $m_j$ and hence it has an analytic extension.

**Remark 9.** Since the set of generalized Fourier-Hermite functionals
\[
\mathcal{M} = \{ \Phi_{(m_1,...,m_N)} \}_{k=1}^{\infty}
\] (62)
is a complete orthonormal set in $L^2(C_{ab}[0,T])$, we could extend the results for functionals in $L^2(C_{ab}[0,T])$ under the appropriate conditions.

**6. Conclusions**

In Section 3, we presented our analysis of the generalized AFSFI and defined the modified generalized AFSFI. Furthermore, we explained the physical circumstances with respect to an anharmonic oscillator using the concept of the modified generalized AFSFI. That is to say, we introduced some new concepts in order to explain various physical circumstances. In Section 4, we established some relationships with respect to the modified generalized AFSFI involving the generalized AFSFI; see Theorem 7. Finally, we applied our results to various classes of functionals studied in [2, 4, 10, 11].
