1. Introduction

Let \( A(p) \) be the class of functions of the form

\[
f(z) = z^p + \sum_{n=1}^{\infty} a_n z^p \quad (p \in \mathbb{N})
\]

which are \( p \)-valent analytic in the open unit disk \( U = \{ z \in \mathbb{C} : |z| < 1 \} \). There and in the following, let \( \mathbb{N} \), \( \mathbb{C} \), and \( \mathbb{R} \) be the sets of positive integers, complex numbers, and real numbers, respectively. A function \( f \) analytic in \( U \) is said to be close-to-convex if there is a convex function \( g \) such that

\[
\text{Re} \left\{ \frac{f'(z)}{g'(z)} \right\} > 0
\]

for all \( z \in U \). The concept of close-to-convex was introduced by Kaplan [1] in 1952. A number of results for close-to-convex functions in \( U \) have been obtained by several authors (see, e.g., [2–14]).

A function \( f \in A(p) \) is said to be in the class \( K_p(\alpha_1, \alpha_2, \beta) \) if it satisfies the following two-sided inequality:

\[
-\frac{\alpha_2 \pi}{2} < \arg \left\{ \frac{f'(z)}{p z^{p-1}} - \beta \right\} < \frac{\alpha_1 \pi}{2} \quad (z \in U)
\]

for \( 0 < \alpha_1, \alpha_2 \leq 1 \) and \( 0 \leq \beta < 1 \). Note that if \( f \in K_p(\alpha_1, \alpha_2, \beta) \), then \( f \) is \( p \)-valent close-to-convex in \( U \). Furthermore, if \( f \in K_p(\alpha, \alpha, \beta) \) \( (0 < \alpha \leq 1, 0 \leq \beta < 1) \), then (3) becomes

\[
\left| \arg \left\{ \frac{f'(z)}{p z^{p-1}} - \beta \right\} \right| < \frac{\alpha \pi}{2} \quad (z \in U).
\]

A function \( f \in K_p(\alpha, \alpha, \beta) \) is called \( p \)-valent close-to-convex of order \( \alpha \) and type \( \beta \) in \( U \).

Given two functions \( f \) and \( g \), which are analytic in \( U \), we say that the function \( g \) is subordinate to \( f \) and write \( g \lessdot f \) or \( g(z) \lessdot f(z) \) \( (z \in U) \), if there exists a Schwarz function \( w \), analytic in \( U \) with \( w(0) = 0 \) and \( |w(z)| < 1 \) \( (z \in U) \) such that \( g(z) = f(w(z)) \) \( (z \in U) \). In particular, if \( f \) is univalent in \( U \), we have the following equivalence:

\[
g(z) < f(z) \quad (z \in U) \iff g(0) = f(0), \quad g(U) \subset f(U).
\]
Throughout this paper, we let
\[ 0 < \alpha_1 \leq 1, \]
\[ 0 < \alpha_2 \leq 1, \]
\[ 0 < \beta < 1, \]
\[ \gamma = \frac{\alpha_1 - \alpha_2}{\alpha_1 + \alpha_2}, \]
\[ c = e^{\gamma i}. \]

In order to prove our main results, we need the following lemmas.

**Lemma 1.** The function \( g \) defined by
\[
g(z) = \left( 1 + cz \right)^{(\alpha_1 + \alpha_2)/2} \quad (g(0) = 1) \tag{7}
\]
is analytic and univalent convex in \( U \) and
\[
g(U) \subset \left\{ w \in \mathbb{C} : -\frac{\alpha_2 \pi}{2} < \arg w < \frac{\alpha_1 \pi}{2} \right\}. \tag{8}
\]

**Proof.** In view of (6), it is easy to see that \(-1 < \gamma < 1\) and the transformation
\[
\zeta = e^{-\gamma i/2} w^{2(\alpha_1 + \alpha_2)} \tag{9}
\]
maps the convex region
\[
G = \left\{ w \in \mathbb{C} : -\frac{\alpha_2 \pi}{2} < \arg w < \frac{\alpha_1 \pi}{2} \right\} \tag{10}
\]
conformally onto the right-half \( \zeta \)-plane \( -\pi/2 < \arg \zeta < \pi/2 \) so that \( w = 1 \) corresponding to \( \zeta = e^{-\gamma i/2} \). Since
\[
z = \frac{\zeta - e^{-\gamma i/2}}{\zeta + e^{-\gamma i/2}} \tag{11}
\]
maps the right-half \( \zeta \)-plane \( \text{Re}(\zeta) > 0 \) onto \( U \), from (7), (9), and (11) we find that
\[
w = \left( e^{(\gamma i/2)} \right)^{(\alpha_1 + \alpha_2)/2} = \left( 1 + cz \right)^{(\alpha_1 + \alpha_2)/2} = g(z) \tag{12}
\]
maps \( U \) conformally onto \( G = g(U) \) with \( g(0) = 1 \). The proof of Lemma 1 is complete. \( \square \)

**Lemma 2** (see [15]). Let the function \( g \) be analytic and univalent in \( U \) and let the functions \( \theta \) and \( \varphi \) be analytic in a domain \( D \) containing \( g(U) \), with \( \varphi(w) \neq 0 \) \((w \in g(U))\). Set
\[
Q(z) = z \varphi'(g(z)) \varphi(g(z)), \quad h(z) = \theta(g(z)) + Q(z) \tag{13}
\]
and suppose that
\[
\begin{align*}
& (i) \ Q \text{ is univalent starlike in } U, \\
& (ii) \ Re \left( z h'(z)/Q(z) \right) = \Re \left( \varphi'(g(z))/\varphi(g(z)) + z Q'(z)/Q(z) \right) > 0(z \in U).
\end{align*}
\]
If \( q \) is analytic in \( U \) with \( q(0) = g(0) \), \( q(U) \subset D \), and
\[
\theta(q(z)) + z q'(z) \varphi(q(z)) < \theta(g(z)) + z g'(z) \varphi(g(z)) = h(z) \quad (z \in U), \tag{14}
\]
then \( q(z) < g(z) \) \((z \in U)\). The function \( g \) is the best dominant of (14).

**Lemma 3** (see [16]). Let \( p(z) \) be analytic function in \( U \) of the form
\[
p(z) = 1 + \sum_{n=m}^{\infty} c_n z^n, \quad c_m \neq 0, \ m \geq 1, \tag{15}
\]
with \( p(z) \neq 0 \) in \( U \). If there exists a point \( z_0 \in U \) such that
\[
\left| \arg p(z_0) \right| = \frac{\pi}{2}, \tag{16}
\]
then
\[
\left| \arg p(z) \right| < \frac{\pi}{2}, \quad |z| < |z_0| \tag{17}
\]
where
\[
k \geq \frac{m}{2} \left( a + \frac{1}{a} \right), \quad \text{when } \arg p(z_0) = \frac{\pi}{2} \tag{19}
\]
and
\[
k \leq -\frac{m}{2} \left( a + \frac{1}{a} \right), \quad \text{when } \arg p(z_0) = -\frac{\pi}{2},
\]
where \( p(z_0) = \pm i a \) and \( a > 0 \).

In this paper we shall derive some criteria for a function \( f \in A(p) \) to be in the class \( K_{\mu}(\alpha_1, \alpha_2, \beta) \).

**2. Main Results**

Our first result is the following theorem.

**Theorem 4.** Let \( \mu \in \mathbb{C} \) and \( s \in \mathbb{R} \). Also let \( |s + 1| \leq 2/(\alpha_1 + \alpha_2) \) and \((s + 1) \text{Re} \mu \geq 0 \). If the function \( q \) is analytic in \( U \) with \( q(0) = 1 \) and \( q(z) \neq 0 \) \((z \in U)\) and satisfies
\[
\mu q(z)^{s+1} + z q'(z) (q(z))^s < h(z) \quad (z \in U), \tag{20}
\]
then
\[
h(z) = \left( \frac{1 + cz}{1 - z} \right)^{(1/2)(s+1)(\alpha_1 + \alpha_2)}.
\]

is close-to-convex in \( U \), then
\[
-\frac{\alpha_1 \pi}{2} < \arg (q(z)) < \frac{\alpha_1 \pi}{2} \quad (z \in U). \tag{22}
\]

The bounds \( \alpha_1 \) and \( \alpha_2 \) in (22) are sharp for the function \( g \) defined by (7).
Proof. We choose
\[ g(z) = \left( \frac{1 + cz}{1 - z} \right)^{(\alpha_1 + \alpha_2)/2}, \]
\[ \theta(w) = \mu w^{s+1}, \]
\[ \varphi(w) = w^s, \]  \hspace{1cm} (23)
in Lemma 2. By Lemma 1, the function \( g \) is analytic and univalent convex in \( U \) and
\[ |\arg g(z)| \leq \max \left\{ \frac{\alpha_1 \pi}{2}, \frac{\alpha_2 \pi}{2} \right\} = \frac{\pi}{2} \quad (z \in U). \]  \hspace{1cm} (24)
Clearly, \( \theta \) and \( \varphi \) are analytic in a domain \( D \) containing \( g(U) \) and \( \varphi(w) \neq 0 \) when \( w \in g(U) \). For
\[ -\frac{2}{\alpha_1 + \alpha_2} \leq s + 1 \leq \frac{2}{\alpha_1 + \alpha_2}, \]  \hspace{1cm} (25)
the function \( Q \) given by
\[ Q(z) = zg'(z)\varphi(g(z)) = \frac{(\alpha_1 + \alpha_2)(1 + c)z}{2(1 - z)^{1+[(1/2)(s+1)](\alpha_1 + \alpha_2)}(1 + cz)^{1-[(1/2)(s+1)](\alpha_1 + \alpha_2)}} \]  \hspace{1cm} (26)
is univalent starlike in \( U \) because
\[ \Re \left[ \frac{2Q'(z)}{Q(z)} \right] = 1 + \left( 1 + \frac{1}{2}(s+1)(\alpha_1 + \alpha_2) \right) \Re \left( \frac{z}{1 - z} \right) \]
\[ - \left( 1 - \frac{1}{2}(s+1)(\alpha_1 + \alpha_2) \right) \Re \left( \frac{cz}{1 + cz} \right) \]
\[ > 1 - \frac{1}{2}(s+1)(\alpha_1 + \alpha_2) \]
\[ - \frac{1}{2}(s+1)(\alpha_1 + \alpha_2) = 0 \quad (z \in U). \]  \hspace{1cm} (27)
Further, we have
\[ \theta(g(z)) + Q(z) = \mu \left( \frac{1 + cz}{1 - z} \right)^{(1/2)(s+1)(\alpha_1 + \alpha_2)} \]
\[ + \frac{(\alpha_1 + \alpha_2)(1 + c)z}{2(1 - z)^{1+[(1/2)(s+1)](\alpha_1 + \alpha_2)}(1 + cz)^{1-[(1/2)(s+1)](\alpha_1 + \alpha_2)}} \]
\[ = h(z), \]
where \( h \) is given by (21) and so
\[ \frac{zh'(z)}{Q(z)} = \mu(s + 1) + \frac{Q'(z)}{Q(z)}. \]  \hspace{1cm} (28)
For \( s + 1 \) Re \( \mu \geq 0 \), it follows from (27) and (29) that
\[ \Re \left[ \frac{zh'(z)}{Q(z)} \right] > 0 \quad (z \in U). \]  \hspace{1cm} (29)
The other conditions of Lemma 2 are also satisfied. Therefore, we conclude that
\[ q(z) < g(z) = \left( \frac{1 + cz}{1 - z} \right)^{(\alpha_1 + \alpha_2)/2} \quad (z \in U) \]  \hspace{1cm} (31)
and the function \( g \) is the best dominant of (20). The proof of the theorem is completed. \( \square \)

Theorem 5. If \( f \in A(p) \) satisfies \( f'(z) \neq 0 \) \( (0 < |z| < 1) \) and
\[ -\beta_2 \pi < \arg \left\{ \frac{f''(z)}{f'(z)} \right\} - p \beta < \beta_1 \pi \]  \hspace{1cm} (32)
for all \( z \in U \), then
\[ \beta_j = \frac{\alpha_j}{2} + \frac{1}{\pi} \tan^{-1} \left( \frac{\alpha_1}{2p} \tan \left( \frac{\alpha_j \pi}{2(\alpha_1 + \alpha_2)} \right) \right) \]  \hspace{1cm} (33)
\( (j = 1, 2) \),
then \( f \in K_p(\alpha_1, \alpha_2, \beta) \). The bounds \( \beta_1 \) and \( \beta_2 \) in (32) are the largest numbers such that (3) holds true.

Proof. For \( f \in A(p) \) satisfying \( f'(z) \neq 0 \) \( (0 < |z| < 1) \), we define the function \( q \) by
\[ \frac{f'(z)}{p^{z-1}} = \beta + (1 - \beta)q(z). \]  \hspace{1cm} (34)
Then \( q \) is analytic in \( U \) with \( q(0) = 1 \) and \( \beta + (1 - \beta)q(z) \neq 0 \) for all \( z \in U \). Taking the logarithmic differentiations in both sides of (34), we have
\[ 1 + \frac{zf''(z)}{f'(z)} = p + \frac{(1 - \beta)zq'(z)}{\beta + (1 - \beta)q(z)} \]  \hspace{1cm} (35)
and
\[ \frac{1}{1 - \beta} \left\{ \frac{f'(z)}{p^{z-1}} \left( 1 + \frac{zf''(z)}{f'(z)} \right) - p \beta \right\} = pq(z) + zq'(z) \]  \hspace{1cm} (36)
for all \( z \in U \). Putting \( s = 0 \) and \( \mu = p \) in Theorem 4 and using (36), we find that if
\[ \frac{1}{1 - \beta} \left\{ \frac{f'(z)}{p^{z-1}} \left( 1 + \frac{zf''(z)}{f'(z)} \right) - p \beta \right\} < h(z), \]  \hspace{1cm} (37)
where
\[ h(z) = \left( \frac{1 + cz}{1 - z} \right)^{(\alpha_1 + \alpha_2)/2} \left( p + \frac{\alpha_1 + \alpha_2}{2} \left( \frac{z}{1 - z} + \frac{cz}{1 + cz} \right) \right), \]  \hspace{1cm} (38)
is (close-to-convex) univalent in \( U \), then
\[ -\frac{\alpha_j \pi}{2} < \arg q(z) < \frac{\alpha_j \pi}{2} \quad (z \in U), \]  \hspace{1cm} (39)
that is, \( f \in K_p(\alpha_1, \alpha_2, \beta) \).
For $z = e^{i\theta}$ ($\theta \in \mathbb{R}$), $z \neq 1$, and $z \neq -1/c$, we have
\[
\frac{z}{1-z} = -\frac{i}{2} \cot \frac{\theta}{2},
\]
\[
\frac{cz}{1+cz} = \frac{1}{2} \tan \frac{\theta + \gamma \pi}{2}
\]
and
\[
\frac{1+cz}{1-z} = \frac{1+e^{i(\theta+\gamma \pi)}}{1-e^{i\theta}} = \frac{\cos((\theta + \gamma \pi)/2)}{\sin(\theta/2)} e^{i(\alpha_1 \pi/(\alpha_1 + \alpha_2))} \neq 0.
\]

Now we consider the following two cases.
(i) If $K(\theta) = \cos \frac{\theta + \gamma \pi}{2} \sin \frac{\theta}{2} = \frac{1}{2} \left( \sin \left( \frac{\theta + \gamma \pi}{2} \right) - \sin \frac{\gamma \pi}{2} \right) > 0$, then we deduce from (38), (40), and (41) that
\[
\begin{align*}
\arg \{ h(e^{i\theta}) \} &= \frac{\alpha_1 \pi}{2} + \tan^{-1} \left( \frac{(\alpha_1 + \alpha_2) \cos (\gamma \pi/2)}{2 p K(\theta)} \right), \\
&= \beta_1 \pi > 0.
\end{align*}
\]

Let $\theta_1 = (\pi/2)(1 + \gamma)$. Then
\[
0 < K(\theta) \leq K(\theta_1) = \frac{1}{2} \left( 1 - \sin \frac{\gamma \pi}{2} \right)
\]
and it follows from (44) and (45) that
\[
\pi > \arg \{ h(e^{i\theta}) \} \geq \arg \{ h(e^{i\theta_1}) \} = \frac{\alpha_1 \pi}{2} + \tan^{-1} \left( \frac{(\alpha_1 + \alpha_2) \cos (\gamma \pi/2)}{2 p (1 - \sin (\gamma \pi/2))} \right)
\]
\[
= \frac{\alpha_1 \pi}{2} + \tan^{-1} \left( \frac{(\alpha_1 + \alpha_2) \tan \left( \frac{\alpha_1 \pi}{2} \right)}{2 (\alpha_1 + \alpha_2)} \right)
= \beta_1 \pi > 0.
\]

(ii) If $K(\theta) < 0$, then it follows from (38) to (41) that
\[
\begin{align*}
\arg \{ h(e^{i\theta}) \} &= -\frac{\alpha_1 \pi}{2} - \tan^{-1} \left( \frac{(\alpha_1 + \alpha_2) \cos (\gamma \pi/2)}{2 p K(\theta)} \right), \\
&= -\beta_2 \pi < 0.
\end{align*}
\]

Noting that $h(0) = p > 0$, we deduce from (46) and (50) that $h(U)$ properly contains the region $-\beta_2 \pi < \arg \{ w \} < \beta_1 \pi$ in the complex $w$-plane. Therefore, if a function $f$ satisfies (32), then the subordination relation (37) holds true. This shows that $f \in K_p(\alpha_1, \alpha_2, \beta_1)$.

Furthermore, for the function $g$ defined by (7), we have
\[
\left. \frac{1}{1 - \beta} \left[ \frac{g' (z)}{p z^{p-1}} \left( 1 + \frac{z g'' (z)}{g' (z)} - p \beta \right) \right] \right|_{z = e^{i\theta}} = h(z).
\]

Hence, by using (46) and (50), we conclude that the bounds $\beta_1$ and $\beta_2$ in (32) are the best possible ones. The proof of the theorem is completed. \(\square\)

**Theorem 6.** Let $\delta > 0$. Also let $\alpha \in \mathbb{C}$ and $0 \leq \theta = \arg \{ \alpha \} < \pi/2$. If $f \in A(p)$ satisfies
\[
-\frac{\pi}{2} + \theta < \arg \left\{ \alpha \left( \frac{1 + z f'' (z)}{f' (z)} - p \right) + \left( \frac{f' (z)}{p z^{p-1}} \right)^{\delta} \right\}
\]
\[
< -\frac{\pi}{2} + \tan^{-1} \frac{\alpha \sin \theta}{2 \delta + \alpha \cos \theta}
\]
for $z \in U$, then
\[
\left. \arg \left\{ \frac{f' (z)}{z^{p-1}} \right\} \right|_{z = e^{i\theta}} < \frac{\pi}{2 \delta} (z \in U).
\]

In particular, if $\delta \geq 1$, then $f \in K_p(1/\delta, 1/\delta, 0)$ or $f$ is $p$-valent close-to-convex of order $1/\delta$.

**Proof.** We denote
\[
q(z) = \left( \frac{f' (z)}{p z^{p-1}} \right)^{\delta}.
\]
Then condition (52) becomes
\[
-\frac{\pi}{2} + \theta < \arg \left\{ q(z) + \frac{\alpha zq'(z)}{\delta} \right\} < \frac{\pi}{2} + \tan^{-1} \frac{|\alpha| \sin \theta}{2\delta + |\alpha| \cos \theta} \quad (z \in U).
\] (55)

We want to prove that
\[
|\arg \{ q(z) \}| < \frac{\pi}{2} \quad \text{for} \quad z \in U.
\] (56)

If there exists a point \( z_0 \) (\(|z_0| < 1\)) such that
\[
|\arg \{ q(z) \}| < \frac{\pi}{2} \quad (|z| < |z_0|),
\] (57)

then, from Lemma 3, we have
\[
\frac{z_0 q'(z_0)}{q(z_0)} = ik,
\] (58)

where \( q(z_0) = za, a > 0 \) and
\[
k \geq \frac{(a^2 + 1)}{2a}, \quad \text{when} \quad |\arg \{ q(z_0) \}| = \frac{\pi}{2},
\] (59)
\[
k \leq -\frac{(a^2 + 1)}{2a}, \quad \text{when} \quad |\arg \{ q(z_0) \}| = -\frac{\pi}{2}.
\]

For the case \( |\arg \{ q(z_0) \}| = \pi/2 \), we have
\[
\arg \left\{ q(z_0) + \frac{\alpha z_0 q'(z_0)}{\delta} \right\} = \arg \left\{ ai + i \frac{k\alpha}{\delta} \right\}
\]
\[
= \frac{\pi}{2} + \arg \left\{ a + \frac{k\alpha}{\delta} \right\} = \frac{\pi}{2} + \tan^{-1} \frac{\text{Im} \{ a + k\alpha/\delta \}}{\text{Re} \{ a + k\alpha/\delta \}}
\]
\[
= \frac{\pi}{2} + \tan^{-1} \frac{|\alpha|}{a + (k\alpha/\delta) \sin \theta}{a + (k\alpha/\delta) \cos \theta}
\]
\[
\geq \frac{\pi}{2} + \tan^{-1} \frac{|\alpha| (a^2 + 1) / 2a\delta}{|\alpha| (a^2 + 1) / 2a\delta} \sin \theta \cos \theta
\]
\[
\geq \frac{\pi}{2} + M(\alpha, \beta),
\]

where
\[
M(\alpha, \beta) = \min_{a>0} \tan^{-1} \frac{|\alpha| (a^2 + 1) \sin \theta}{(2\delta + |\alpha| \cos \theta) a^2 + |\alpha| \cos \theta}.
\] (61)

The function
\[
g(a) = \frac{|\alpha| (a^2 + 1) \sin \theta}{(2\delta + |\alpha| \cos \theta) a^2 + |\alpha| \cos \theta}, \quad a > 0,
\] (62)

has a negative derivative
\[
g'(a) = \frac{-4a\delta |\alpha| \sin \theta}{((2\delta + |\alpha| \cos \theta) a^2 + |\alpha| \cos \theta)^2} \leq 0
\] (63)

for \( 0 \leq \theta < \frac{\pi}{2} \).

Hence
\[
M(\alpha, \beta) = \lim_{a \to \infty} \tan^{-1} \frac{|\alpha| \sin \theta}{2\delta + |\alpha| \cos \theta}.
\] (64)

Therefore, (60) becomes
\[
|\arg \{ q(z_0) + \frac{\alpha z_0 q'(z_0)}{\delta} \right\} | \geq \frac{\pi}{2} + \tan^{-1} \frac{|\alpha| \sin \theta}{2\delta + |\alpha| \cos \theta},
\] (65)

which contradicts (55). Thus
\[
|\arg \{ q(z) \}| < \frac{\pi}{2} \quad \text{for} \quad z \in U.
\] (66)

For the case \( \arg \{ q(z_0) \} = -\pi/2 \), we have \( k < 0 \). Applying the same method as the above, we get
\[
\arg \left\{ q(z_0) + \frac{\alpha z_0 q'(z_0)}{\delta} \right\} = \arg \left\{ -ai + i \frac{k\alpha}{\delta} \right\}
\]
\[
= -\frac{\pi}{2} + \arg \left\{ a - \frac{k\alpha}{\delta} \right\} \leq -\frac{\pi}{2} + \theta.
\] (67)

This contradicts (55). The proof of the theorem is completed. \( \Box \)

Applying the same method as the above we can prove the following theorem.

**Theorem 7.** Let \( \delta > 0 \). Also let \( \alpha \in \mathbb{C} \) and \(-\pi/2 < \theta = \arg [\alpha] \leq 0 \). If \( f \in A(p) \) satisfies
\[
-\frac{\pi}{2} + \tan^{-1} \frac{|\alpha| \sin \theta}{2\delta + |\alpha| \cos \theta}
\]
\[
< \arg \left\{ \alpha \left( 1 + \frac{zf''(z)}{f'(z)} - p \right) + \left( \frac{f'(z)}{pz^{p-1}} \right)^{\delta} \right\}
\]
\[
< \frac{\pi}{2} + \theta
\] (68)

for \( z \in U \), then
\[
\left| \arg \left\{ \frac{f'(z)}{z^{p-1}} \right\} \right| < \frac{\pi}{2\delta} \quad (z \in U).
\] (69)

In particular, if \( \delta \geq 1 \), then \( f \in K_p(1/\delta, 1/\delta, 0) \) or \( f \) is \( p \)-valent close-to-convex of order \( 1/\delta \).
