As is well known, the extreme points and strongly extreme points play important roles in Banach spaces. In this paper, the criterion for strongly extreme points in Orlicz spaces equipped with s-norm is given. We complete solved criterion for Orlicz space that generated by Orlicz function. And the sufficient and necessary conditions for middle point locally uniformly convex in Orlicz spaces equipped with s-norm are obtained.

1. Introduction

The extreme point set plays a crucial role in function analysis, convex analysis, and optimization. In fact, any compact convex set is the convex hull of its extreme point set, and the result is called Krein-Milman theorem. The notion of a dentable subset of a Banach space was introduced by Rieffel [1] in conjunction with a Radon-Nikodym theorem for Banach space-valued measures. Subsequent work by Maynard [2] and by Davis and Phelps [3] has shown that those Banach spaces in which Rieffel’s Radon-Nikodym theorem is valid are precisely the ones in which every bounded closed convex set is dentable. This is a real breakthrough in studying the nature of Radon-Nikodym as a geometric property. In 1988, Bor-Luh Lin, Pei-Kee Lin, and S. L. Troyanski [4] described the characteristic of denting points and obtained the notion that there is a close relationship between denting points and strongly extreme points. It is easy to see that every denting point of K is a strongly extreme point of K and it is known that [Ken Kunen and Haskeil Rosenthal, Martingale proofs of some geometrical results in Banach space theory, Pacific J. Math. 100 (1982), 153-175] that every strongly extreme point of K is a weak∗-extreme point of K. Orlicz space is a special kind of Banach space; it was introduced by the famous Polish mathematician W. Orlicz in 1932. The theory of Orlicz space [5, 6] has been greatly developed because of its important theoretical properties and application value. Up to now, the criterion of an element in the unit sphere of Orlicz spaces equipped with the Orlicz norm [5, 7], the Luxemburg norm [5], and p-Amemiya norm [8] has been given. In this paper, we use a new technique to study the strongly extreme point in Orlicz spaces generated by Orlicz function and equipped with a new norm, namely, s-norm. The criterion of strongly extreme points is given, and the sufficient and necessary conditions for middle point locally uniformly convex in Orlicz spaces equipped with s-norm are obtained.

2. Preliminaries

Throughout this paper, X will denote a Banach space and X∗ stands for the dual space of X. We denote by (G, Σ, μ) the nonatomic Σ-measure finite space. By B(X) and S(X) we denote the unit ball and the unit sphere of X, respectively. By R and N we will denote the sets of real and natural numbers, respectively.

A mapping Φ : R → [0, ∞) is said to be an Orlicz function if it is even, continuous, convex, and Φ(0) = 0, lim_{u→∞} Φ(u) = ∞. Moreover, if Φ satisfies lim_{u→0} (Φ(u)/u) = 0 and lim_{u→∞} (Φ(u)/u) = ∞, Φ is called N-function. Let p_+(t) be the right-hand derivative of Φ, where the function Ψ is defined by the formula

Ψ(u) = \sup \{ |v| v − Φ(v) : v ≥ 0 \} (1)
and called complementary function to $\Phi$ in the sense of Young.

We say that an Orlicz function $\Phi$ satisfies $\triangle_2$-condition for large $u \in R$ ($\Phi \in \triangle_2$ for short) if there exist $u_0 > 0$ and $K > 2$ such that

$$\Phi(2u) \leq K\Phi(u)$$

(2)

whenever $|u| > u_0$.

Let $L^0$ denote the set of all measure real functions on $G$. For a given Orlicz function $\Phi$ we define on $L^0$ a convex function $I_\Phi : L^0 \to [0, \infty]$ (called a pseudomodular; see [6]) by

$$I_\Phi(x) = \int_G \Phi(x(t)) dt.$$  

(3)

It is clear that $I_\Phi(x) = \int_{\text{supp}(x)} \Phi(x(t)) dt$; here supp(x) = \{t \in G : |x(t)| \neq 0\}.

The Orlicz space $L_\Phi$ generated by an Orlicz function $\Phi$ is defined by the formula

$$L_\Phi = \{x \in L^0 : I_\Phi(\lambda x) < +\infty \text{ for some } \lambda > 0\},$$

(4)

and its subspace $E_\Phi$ is defined by

$$E_\Phi = \{x \in L^0 : I_\Phi(\lambda x) < +\infty \text{ for all } \lambda > 0\}.$$  

(5)

This space is usually equipped with the Luxemburg norm [5]

$$\|x\| = \inf \left\{ k > 0 : I_\Phi(\frac{x}{k}) \leq 1 \right\},$$

(6)

or with the Orlicz norm (Amemiya norm) [5]

$$\|x\|_\Phi = \inf_{k > 0} \frac{1}{k} (1 + I_\Phi(kx)).$$

(7)

A function $s : [0, \infty) \to [1, \infty)$ will be called an outer function, if it is convex and

$$\max \{1, u\} \leq s(u) \leq 1 + u \text{ for all } u \geq 0.$$  

(8)

In 2017, M. Wisła introduced $s$-norm.

Definition 1. Let $s$ be an outer function. Denote $s$-norm on Orlicz spaces by the formula

$$\|x\|_{s,\phi} = \inf \frac{1}{k>0} s(I_\Phi(kx)).$$

(9)

It is easy to get $\|x\|_{s,\phi} = \|x\|$ if $s(u) = \max \{1, u\}$ and $\|x\|_{s,\phi} = \|x\|_\Phi$ if $s(u) = 1 + u$ ([8]). Then we have $\|x\| \leq \|x\|_{s,\phi} \leq \|x\|_\phi$.

Definition 2. Let $s'_v(u)$ be the right-hand derivative of $s$. For all $0 \leq v \leq 1$, define

$$\omega(v) = \int_0^v s_v'^{-1}(t) dt$$

(10)

Definition 3. Let $s$ be an outer function. For all $0 \leq u < \infty$ and $0 \leq v < \infty$,

$$\beta_s(u, v) = 1 - \omega(s'_v(u)) - vs'_v(u),$$  

(11)

the function $\beta_s(u, v)$ is nonincreasing. For any $x \in L_{\Phi,s} \setminus \{0\}$, define ([9])

$$k^*(x) = \inf \left\{ k > 0 : \beta_s(I_\Phi(kx), I_\Phi(p_*(|x|))) \leq 0 \right\},$$

(12)

$$k^{**}(x) = \inf \left\{ k > 0 : \beta_s(I_\Phi(kx), I_\Phi(p_*(|x|))) \geq 0 \right\}. $$

Let $K(x) = [k^*(x), k^{**}(x)]$. Then $\|x\|_{s,\phi} = (1/k)s(I_\Phi(kx))$ if and only if $K(x) \neq 0$.

Definition 4. A point $x \in S(X)$ is said to be an extreme point of $B(X)$ if for any $y, z \in B(X)$ with $x = (y+z)/2$, then implies $y = z$.

The set of all extreme points of the unit ball $B(X)$ will be denoted by $ExtB(X)$. $X$ is said to be strictly convex if $ExtB(X) = S(X)$.

Definition 5. A point $x \in S(X)$ is said to be a strongly extreme point of $B(X)$ if for any $\{x_n\} \subseteq X, \{\|y_n\| \in X \text{ with } \|x_n\| \to 1, \|y_n\| \to 1 \text{ and } (x_n + y_n)/2 = x \text{ there holds } \|x_n - y_n\| \to 0$ as $n \to \infty$.

It is obvious that a strongly extreme point is an extreme point. $X$ is said a middle point locally uniformly convex Banach space if and only if each point on $S(X)$ is a strongly extreme point.

Definition 6. Let $u_0 > 0$. If for every $v, w \in R$ such that $v \neq w$ and $(v + w)/2 = u_0$, we have $\Phi(u_0) < (1/2)\Phi(v) + (1/2)\Phi(w)$, then $u_0$ is called to be a strictly convex point of $\Phi(u)$. The set of all strictly convex points of $\Phi(u)$ will be denoted by $S_\phi$.

For the results concerning strongly extreme points and convexities in Orlicz spaces which are generated by $N$-function and equipped with the Orlicz norm, the Luxemburg norm, and $p$-Amemiya norm, we refer a reader to [10–17].

3. Main Theorem

Lemma 7. (1) If $\lim_{u \to \infty}(\Phi(u)/u) = \infty$ then $K(x) \neq 0$ for any $x \in L_{\Phi,s} \setminus \{0\}$;

(2) If $\lim\limits_{u \to \infty}(\Phi(u)/u) = A < \infty$ and $K(x) = 0$ then $\|x\|_{s,\phi} = A\|x\|_1$.

Proof. (1) Suppose $\lim\limits_{u \to \infty}(\Phi(u)/u) = \infty$. We have $\lim\limits_{k \to \infty} I_\Phi(p_*(k|x|)) = \infty$. Since for any $0 \leq u \leq 1, \omega(v) \in [0, 1]$, then

$$\lim_{k \to \infty} \beta_s(I_\Phi(kx), I_\Phi(p_*(k|x|))) = \lim_{k \to \infty} \left(1 - \omega\left(s'_v(I_\Phi(kx))\right) - I_\Phi(p_*(k|x|))s'_v(I_\Phi(kx))\right) < 0.$$  

(13)

So $k^*(x) < \infty$, whence $K(x) \neq 0$. 

(2) By $K(x) = 0$, we have $k^*(x) = \infty$, and then
\[
\|x\|_{\Phi,s} = \inf_{k \to 0} \frac{1}{k} I_\Phi(kx) = \lim_{k \to \infty} \frac{1}{k} I_\Phi(kx)
\]
\[
\leq \lim_{k \to \infty} \frac{1}{k} (1 + I_\Phi(kx)) = \lim_{k \to \infty} \left( 1 + \int_{\supp(x)} \frac{\Phi(kx(t))}{k |x(t)|} |x(t)| \, dt \right)
\]
\[
= A \|x\|_1,
\]
and
\[
\|x\|_{\Phi,s} = \lim_{k \to \infty} \frac{1}{k} I_\Phi(kx) \geq \lim_{k \to \infty} \frac{1}{k} I_\Phi(kx)
\]
\[
= \lim_{k \to \infty} \int_{\supp(x)} \frac{\Phi(kx(t))}{k |x(t)|} |x(t)| \, dt = A \|x\|_1.
\]

Therefore $\|x\|_{\Phi,s} = A \|x\|_1$. \(
\]

**Corollary 8.** $K(x) = 0$ if and only if $\mu(\supp(x)) < (1 - \omega(1))\Psi(A)$ for any $x \in L_{\Phi,s} \setminus \{0\}$.

**Proof.** Necessity. We know that $I_\Phi(kx) \to \infty$ as $k \to \infty$. By $I_\Phi(kx) \leq s(I_\Phi(kx)) \leq 1 + I_\Phi(kx)$, we can get $1 \leq \lim_{k \to \infty} s(I_\Phi(kx)) \leq 1$. That is, $\lim_{k \to \infty} s(I_\Phi(kx)) = 1$. By $K(x) = 0$, we have $k^*(x) = \infty$. Then
\[
\beta_\Phi(kx) = \frac{1}{k} I_\Phi(p_k(k|x|)) > 0,
\]
for all $k > 0$. Since $\beta_\Phi(u,v)$ is nonincreasing, we have
\[
\lim_{k \to \infty} \beta_\Phi(kx) = \lim_{k \to \infty} \left( 1 - \omega\left( s\left( I_\Phi(kx)\right) \right) \right) = 1 - \omega\left( s\left( I_\Phi(kx)\right) \right)
\]
\[
= 1 - \omega\left( \supp(x) \Psi(A) \right) > 0,
\]
whence $\mu(\supp(x)) < (1 - \omega(1))\Psi(A)$.

Here we infer that $\omega(1) < 1$. If $\omega(1) = 1$ we have
\[
\lim_{k \to \infty} \beta_\Phi(kx) = \lim_{k \to \infty} \beta_\Phi(kx) = -\supp(x)\Psi(A) < 0,
\]
whence $\mu(\supp(x)) < (1 - \omega(1))\Psi(A)$.

Therefore $\omega(1) < 1$. If $\omega(1) = 1$ we have
\[
\lim_{k \to \infty} \beta_\Phi(kx) = \lim_{k \to \infty} \beta_\Phi(kx) = -\supp(x)\Psi(A) < 0,
\]
whence $\mu(\supp(x)) < (1 - \omega(1))\Psi(A)$.

**Sufficiency.** By the definitions of $s(u)$ and $\omega(v)$, $s'(u) \leq 1$ and $\omega(s'(u)) \leq \omega(1)$ for any $u > 0$. Therefore for all $k > 0$
\[
\beta_\Phi(kx) = \frac{1}{k} I_\Phi(p_k(k|x|))
\]
\[
= 1 - \omega\left( s\left( I_\Phi(kx)\right) \right) - I_\Phi\left( {p_k(k|x|)}\right) s\left( I_\Phi(kx)\right)
\]
\[
\geq 1 - \omega\left( \supp(x) \Psi(A) \right) > 0,
\]
whence $k^*(x) = \infty$, i.e., $K(x) = 0$. \(
\]

**Theorem 9.** Suppose that $s(u) > 1$ when $u > 0$ and $\Phi$ is an Orlicz function. A point $x_0 \in S(L_{\Phi,s})$ is a strongly extreme point if and only if $\Phi \in \Delta_2$ and $k_0x_0(t) \in S_\Phi$ for $k_0 \in K(x_0)$. 

**Proof.** Necessity. As we know that a strongly extreme point is an extreme point, we only need to prove that $x_0 \in Ext(B(L_{\Phi,s}))$ implies $k_0x_0(t) \in S_\Phi$ for $k_0 \in K(x_0)$. Firstly, we will prove that if $x_0 \in Ext(B(L_{\Phi,s}))$, then $K(x_0) \neq 0$. If $K(x_0) = 0$, we will have $k^*(x_0) = \infty$ which implies that $\mu(\supp(x_0)) < (1 - \omega(1))\Psi(A)$ holds. There exists $a > 0$ such that $\mu(t \in G : |x_0(t)| > a) > 0$. Put $C = \{t \in G : |x_0(t)| > a\}$ and $0 < \mu(C) < (1 - \omega(1))\Psi(A)$.

Divide $C$ into two sets $C_1$ and $C_2$ with $C_1 \cap C_2 = \emptyset$ and $\mu(C_1) = \mu(C_2)$. Take $\varepsilon \in (0,a)$ and define
\[
\begin{cases}
    x_0(t), & t \in G \setminus (C_1 \cup C_2) \\
    x_0(t) - \varepsilon, & t \in C_1 \\
    x_0(t) + \varepsilon, & t \in C_2,
\end{cases}
\]
\[
y(t) = \begin{cases}
    x_0(t) - \varepsilon, & t \in C_1 \\
    x_0(t) + \varepsilon, & t \in C_2
\end{cases}
\]
\[
z(t) = \begin{cases}
    x_0(t), & t \in G \setminus (C_1 \cup C_2) \\
    x_0(t) + \varepsilon, & t \in C_1 \\
    x_0(t) - \varepsilon, & t \in C_2.
\end{cases}
\]

Then $x_0 = (y + z)/2$, $y \neq z$. Moreover $\supp(y) \subseteq \supp(x_0)$, $\supp(z) \subseteq \supp(x_0)$. We have
\[
\|y\|_{\Phi,s} = A \|y\|_1 = A \int_G |y(t)| \, dt
\]
\[
= A \left( \int_{C_1} |x_0(t) - \varepsilon| \, dt + \int_{C_2} |x_0(t) + \varepsilon| \, dt \right)
\]
\[
+ \int_{G \setminus (C_1 \cup C_2)} |x_0(t)| \, dt = A \int_G |x_0(t)| \, dt
\]
\[
= A \|x_0\|_1 = \|x_0\|_{\Phi,s} = 1.
\]

Similarly, we can get $\|z\|_{\Phi,s} = 1$.

Next we will show that $k_0x_0(t) \in S_\Phi$.

Suppose that $\mu(t \in G : k_0x_0(t) \notin S_\Phi) > 0$ for $k_0 \in K(x_0)$. There exists an interval $(a,b)$ such that $\mu(t \in G : a/k_0 + \varepsilon < x_0(t) < b/k_0 - \varepsilon) > 0(\varepsilon > 0)$, and $\Phi$ is affine on $(a,b)$: $\Phi(x) = px + q$. Divide $G \setminus (a/b + c) < b/k_0 - \varepsilon$ into two sets $E$ and $F$ with $E \cap F = \emptyset$ and $\mu(E) = \mu(F)$. Define
\[
\begin{cases}
    x_0(t), & t \in G \setminus (E \cup F) \\
    x_0(t) - \varepsilon, & t \in E \\
    x_0(t) + \varepsilon, & t \in F
\end{cases}
\]
\[
y(t) = \begin{cases}
    x_0(t) - \varepsilon, & t \in E \\
    x_0(t) + \varepsilon, & t \in F
\end{cases}
\]
\[
z(t) = \begin{cases}
    x_0(t), & t \in G \setminus (E \cup F) \\
    x_0(t) + \varepsilon, & t \in E \\
    x_0(t) - \varepsilon, & t \in F
\end{cases}
\]

Then $x_0 = (y + z)/2$, $y \neq z$. Thus
\[
\|x_0\|_{\Phi,s} = A \|x_0\|_1 = A \int_G \Phi(k_0 y(t)) \, dt
\]
\[
+ \int_G \Phi(k_0 y(t)) \, dt
\]
\[= \int_E \left( p\left(k_0 \left(x_0(t) - \varepsilon\right)\right) + q\right) dt + \int_E \left( p\left(k_0 \left(x_0(t) + \varepsilon\right)\right) + q\right) dt + \int_{G_0} \Phi(k_0 x_0(t)) dt \]
\[= \int_{A_0} (pk_0 x_0(t) + q) dt + \int_{G_0} \Phi(k_0 x_0(t)) dt \]
\[= \Phi(k_0 x_0(t)) dt + \int_{G_0} \Phi(k_0 x_0(t)) dt \]
\[= \int_{G_0} \left( \Phi(k_0 x_0(t)) dt \right) + \int_{G_0} \left( \Phi(k_0 x_0(t)) dt \right) \]
\[= I_{A_0}(k_0 x_0) \]
\[(22)\]

whence \(\|y\|_{\Phi, a} \leq (1/k_0) s(I_{A_0}(k_0 y)) = (1/k_0) s(I_{A_0}(k_0 x_0)) = \|x_0\|_{\Phi, a} = 1\). In the same way, we can prove \(\|x\|_{\Phi, a} \leq 1\). This contradicts the fact that \(x_0\) is an extreme point of \(B(\Phi, a)\).

In order to complete this proof, we need to prove that if \(\Phi \notin \Delta_a\), there are no strongly extreme points in \(S(\Phi, a)\).

Suppose \(\Phi \notin \Delta_a\). Then \(\lim_{n \to \infty} \Phi(u) = +\infty\).

In fact, if \(\lim_{n \to \infty} \Phi(u) = A < +\infty\), there exists \(u_0 > 0\) such that \((A/2)u < \Phi(u) < (3A/2)u\) holds for every \(u > u_0\).

Then we have \(\Phi(2u) < (3A/2)(2A/2) < 6(A/2)u < 6\Phi(u)\); it implies \(\Phi \notin \Delta_a\), a contradiction.

For any \(x_0 \in S(\Phi, a)\), there exists \(k_0 > 0\) such that
\[1 = \|x_0\|_{\Phi, a} = \frac{1}{k_0} s(I_{A_0}(k_0 x_0)). \quad (23)\]

Since \(x_0 \in S(\Phi, a)\), we can find \(d > 0\) such that \(\mu(t \in G : |x(t)| \leq d) > 0\). By \(\Phi \notin \Delta_a\), there exist \(u_0 > 0\) and \(u_0 \uparrow +\infty\) such that \(\Phi(2u_n) > 2\Phi(u_n)(n = 1, 2, \cdots)\). We may assume that \(\Phi(u) < \mu(t \in G : |x(t)| \leq d)\). Take \(\{G_n\} \subset \{t \in G : |x(t)| \leq d\}\) with \(G_n \cap G_m = \emptyset\) for any \(m \neq n\), satisfying \(\mu(G_n) = 1/(2^n\Phi(u_n))(n = 1, 2, \cdots)\). Define
\[x_n(t) = \begin{cases} x_0(t), & t \in G \setminus G_n \\ x_0(t) + \frac{u_n}{k_0}, & t \in G_n, \end{cases} \quad (24)\]
\[y_n(t) = \begin{cases} x_0(t), & t \in G \setminus G_n \\ x_0(t) - \frac{u_n}{k_0}, & t \in G_n. \end{cases} \]

Then \(x_0 = (x_n + y_n)/2\), \(x'_n(t) = x'_n(t) + x''_n(t)\), here \(x'_n(t) = x_0 x_{G_0} G(t) + (u_n/k_0) x_{G_0}(t), x''_n(t) = x_0 x_{G_0} G(t)\).

Notice that
\[\|x''_n\|_{\Phi, a} = \|x_0 x_{G_0} G(t)\|_{\Phi, a} \leq \|x_0\|_{\Phi, a} \to \infty \quad (n \to \infty). \quad (25)\]

We have \(x''_n \geq x_0 x_{G_0} G(t) \geq x_0 x_{G_0} G(t)\), that is, \(\lim_{n \to \infty} \|x''_n\|_{\Phi, a} \geq \|x_0\|_{\Phi, a} = 1\). And
\[\|x''_n\|_{\Phi, a} = \inf_{k_0 \to \infty} \|I_{A_0}(k_0 x'_n)\| \leq \|x_0\|_{\Phi, a} \quad (26)\]

Consequently, \(\lim_{n \to \infty} \|x''_n\|_{\Phi, a} = 1\). Hence \(\lim_{n \to \infty} \|x_n\|_{\Phi, a} = 1\). In the same way, we have \(\lim_{n \to \infty} \|y_n\|_{\Phi, a} = 1\). But \(I_{A_0}(k_0 x_n - y_n) = \int_{G_0} \Phi(2u_n(t)/k_0) dt = \Phi(2u_n(t)/k_0) dt > \Phi(2u_n(t)/k_0) dt \geq 1/n\), which implies \(\|x_n - y_n\|_{\Phi, a} = (1/k_0) \|2u_n X_G G\|_{\Phi, a} \geq 1/k_0, \|x_n - y_n\|_{\Phi, a} \geq 1/k_0\), a contradiction.

**Sufficiency.** Let \(\Phi \notin \Delta_a\), then \(x_n(t) \in S(\Phi, a)\) with \(k_0 x_n(t) \in S_0\) for \(k_0 \in K(x_0)\). Take any \(x_n, y_n \in L_{\Phi, a}\), with \(\|x_n\|_{\Phi, a} \to 1\) and \(\|y_n\|_{\Phi, a} \to 1\).

Take sequences \(\{k_n\}\) and \(\{h_n\}\) of positive numbers such that
\[\|x_n\|_{\Phi, a} \geq \frac{1}{k_n} s(I_{A_0}(k_n x_n)) - \frac{1}{n}, \quad (27)\]
\[\|y_n\|_{\Phi, a} \geq \frac{1}{h_n} s(I_{A_0}(h_n y_n)) - \frac{1}{n}. \quad (28)\]

Define
\[x'_n = \frac{x_n + x_0}{2}, \quad y'_n = \frac{y_n + x_0}{2} \quad (29)\]

then \(x'_n + y'_n = 2x_0\) and \(\lim_{n \to \infty} \|x'_n\|_{\Phi, a} \leq 1, \|y'_n\|_{\Phi, a} \leq 1\). Otherwise, we can assume that \(\|x'_n\|_{\Phi, a} < 1\); there exist \(\delta > 0\) and \(n_0 \in N\) such that, for every \(n \geq n_0\),
\[\|x'_n\|_{\Phi, a} \leq 1 - \delta, \quad (29)\]
\[\|y'_n\|_{\Phi, a} \leq 1 + \delta. \quad (30)\]

Then
\[1 = \|x_0\|_{\Phi, a} = \|x'_n + y'_n\|_{\Phi, a} \leq \frac{1}{2} \left(1 - \delta + 1 + \delta\right) \frac{1}{2} \quad (n \to \infty), \quad (29)\]

a contradiction.
Since \(\|x'_n - y'_n\|_{\mathcal{F},\sigma} \to 0\) if and only if \(\|x_n - y_n\|_{\mathcal{F},\sigma} \to 0\) \((n \to \infty)\), we will consider the sequences \(\{x'_n\}\) and \(\{y'_n\}\), where \(\{x'_n\}\) and \(\{y'_n\}\) in place of \(\{x_n\}\) and \(\{y_n\}\).

Put \(k'_n = 2k_nk_0/(k_n + k_0)\) and \(h'_n = 2h_nk_0/(h_n + k_0)\). Then \(\{k'_n\}\) and \(\{h'_n\}\) are bounded. Since \(\|x'_n\|_{\mathcal{F},\sigma} \to 1\) \((n \to \infty)\), we have

\[
1 \iff \|x'_n\|_{\mathcal{F},\sigma} \leq \frac{1}{k_n} s(I_\Phi(k'_n x'_n)) \\
= \frac{k_k + k_0}{2k_nk_0} s(I_\Phi\left(\frac{k_kk_0}{k_n + k_0} (x_n + x_0)\right)) \\
\leq \frac{1}{2} \left(\frac{1}{k_0} s(I_\Phi(k_0x_0)) + \frac{1}{k_n} s(I_\Phi(k_nx_n))\right) \\
\leq \frac{1}{2}\left(\|x_0\|_{\mathcal{F},\sigma} + \|x_n\|_{\mathcal{F},\sigma} + \frac{1}{n}\right) \to 1 \quad (n \to \infty),
\]

whence it follows that

\[
\frac{1}{k_n} s(I_\Phi(k'_n x'_n)) \to 1 \quad (n \to \infty). \tag{32}
\]

Analogously,

\[
\frac{1}{h_n} s(I_\Phi(h'_n y'_n)) \to 1 \quad (n \to \infty). \tag{33}
\]

Put \(d = \sup_n\{k'_n, h'_n\} < \infty\). Assume that \(k'_n \to k\) and \(h'_n \to h\) as \(n \to \infty\). Now we prove \(k, h \geq 1\). Since

\[
1 \iff \frac{1}{k_n} s(I_\Phi(k'_n x'_n)) \to 1 \quad (n \to \infty), \tag{34}
\]

then

\[
s(I_\Phi(k'_n x'_n)) \to k \quad (n \to \infty), \tag{35}
\]

and if \(k < 1\), consequently, \(s(I_\Phi(k'_n x'_n)) \to 1 \) as \(n \to \infty\), a contradiction. Thus \(k \geq 1\). Similarly, \(h \geq 1\). Then we have \(h/(k + h), h/(k + h) \in [1/(1 + d), d/(1 + d)]\).

**Step 1.** We will show that \(k_0 = 2kh/(k + h)\). In fact

\[
1 = \|x_0\|_{\mathcal{F},\sigma} = \frac{1}{k_0} s(I_\Phi(k_0x_0)) \leq \frac{k'_0 + h'_0}{2k_0h_0} \\
\cdot s(I_\Phi(\frac{2k'_0h'_0}{k'_0 + h'_0} x'_n)) \leq \frac{k'_0 + h'_0}{2k'_0h'_0} \\
\cdot s(I_\Phi(\frac{k'_0h'_0 + h'_0k'_0}{2k'_0h'_0} x'_n y'_n)) \leq \frac{k'_0 + h'_0}{2k'_0h'_0} \\
\cdot s(I_\Phi(\frac{h'_0}{k'_0 + h'_0} k'_0 y'_n + I_\Phi(\frac{k'_0}{k'_0 + h'_0} h'_0 y'_n))) \\
\leq \frac{1}{2} \left(\frac{1}{k'_0} s(I_\Phi(k'_0 x'_n)) + \frac{1}{h'_0} s(I_\Phi(h'_0 y'_n))\right) \to 1 \quad (n \to \infty),
\]

whence \(2k'_0h'_0/(k'_0 + h'_0) \to 2kh/(k + h) = k_0 \in K(x_0)\) as \(n \to \infty\).

**Step 2.** We will show that \(k'_0 x'_n - k_0 x_0 \sim 0\) \((n \to \infty)\).

Firstly, we will prove that \(k'_0 x'_n - h'_0 y'_n \to 0\) \((n \to \infty)\).

Otherwise, there exist \(\sigma_0, \varepsilon_0 > 0\) such that \(\mu(\{t \in G : |k x'_n(t) - h y'_n(t)\} \geq \sigma_0\}) \geq \varepsilon_0\). Let \(D = \Phi^{-1}(3/\varepsilon_0)\) and \(D_1 = 2kD\). Let \(G_n = \{t \in G : |k x'_n(t) - h y'_n(t)\} \leq D_1\}\). We can be easy to calculate that \(\mu(G_n) > \varepsilon_0/3\). Hence

\[
\mu(G_n) \geq \frac{\mu}{3} \left(\{t \in G : |k x'_n(t) - h y'_n(t)\} \geq \sigma_0\}\right) \\
- \frac{\mu}{3} \left(\{t \in G : |k x'_n(t) > D_1\}\right) \\
- \frac{\mu}{3} \left(\{t \in G : |h y'_n(t) > D_1\}\right) \\
> \varepsilon_0 - \frac{\varepsilon_0}{3} - \frac{\varepsilon_0}{3} - \frac{\varepsilon_0}{3}.
\]

We know that \(S_{\Phi}\) is a close set. Let

\[
F = \left\{ (x, y) : |x| \leq D_1, |y| \leq D_1, |x - y| \right\} \tag{39}
\]

\[
\geq \sigma_0, \frac{h}{k + h} x + \frac{k}{k + h} y \in S_{\Phi}. \tag{40}
\]

\(F\) is a bounded close set. For every \((x, y) \in F\), the continuous function is

\[
\Phi\left(\frac{h}{k + h} x + \frac{k}{k + h} y\right) /
\Phi(x) + (k/(k + h)) \Phi(y) < 1. \tag{41}
\]

Set maximum value equal to \(1 - \delta (\delta > 0)\). For every \((x, y) \in F\), we have

\[
\Phi\left(\frac{h}{k + h} x + \frac{k}{k + h} y\right) \leq (1 - \delta)\left(\frac{h}{k + h} \Phi(x) + \frac{k}{k + h} \Phi(y)\right). \tag{42}
\]

Since \(k_0 x_0(t) \in S_{\Phi}\), we have

\[
\frac{h}{k + h} k_0 x'_n(t) + \frac{k}{k + h} h_0 y'_n(t) = \frac{2kh}{k + h} x_0(t) = k_0 x_0 \quad \text{in} S_{\Phi}. \tag{43}
\]
for \( t \in G \). Therefore, \((kx_n'(t), hy_n'(t)) \in F\), i.e., for \( t \in G_n\), and

\[
\Phi \left( \frac{h}{k+h}x_n'(t) + \frac{k}{k+h}y_n'(t) \right) \leq (1 - \delta) \left( \frac{h}{k+h} \Phi \left( kx_n'(t) + \frac{k}{k+h} \Phi \left( hy_n'(t) \right) \right) \right).
\]

Hence

\[
\left\| x_n' + y_n' \right\|_{\Phi, s} \leq \frac{k + h}{kh} \left( \int_G \Phi \left( \frac{kh}{k+h} x_n'(t) + \frac{k}{k+h} \Phi \left( hy_n'(t) \right) \right) dt \right) \leq \frac{k + h}{kh} \left( 1 - \delta \right) \int_G \left[ \frac{h}{k+h} \Phi \left( kx_n'(t) \right) + \frac{k}{k+h} \Phi \left( hy_n'(t) \right) \right] dt.
\]

Similarly, we can get \((1/h)(I_\Phi(hy_n')) - \left\| y_n' \right\|_{\Phi, s} \rightarrow 0(n \rightarrow \infty)\). Then \(\left\| x_n' + y_n' \right\|_{\Phi, s} \leq 2 - ((k + h)/kh)(s(2\delta/(1 + d)))\Phi(\sigma(2)/(\epsilon(2)))\) as \(n \rightarrow \infty\). By \(s(u) > 1\) when \(u > 0\), we have \(\lim_{n \rightarrow \infty} \left\| x_n' + y_n' \right\|_{\Phi, s} \leq 2\). The contradiction shows that \(kx_n' - hy_n' \rightarrow 0\).

Since \(s\)-norm is equivalent with the Luxemburg norm, their weak topology and weak star topology are all equivalent. Then \(L_{\Phi, s}\) is \(w^*\)-compact. Take \(\{x_n'\} \subset \{y_n'\}, \{y_n''\} \subset \{y_n'\}\) such that \(x_n' \rightarrow y'\) and \(y_n'' \rightarrow y''\). We can get \(x' + y'' = 2x_0\). By

\[
\left\| x \right\|_{\Phi, s} = \sup \left\{ \int_G x(t) y(t) dt : y \in B(L^*_{\Phi, s}) \right\},
\]

where \(B(L^*_{\Phi, s})\) represents the unit ball of the dual space of \(E_{\Phi, s}\), and

\[
\left\| x \right\|_{\Phi, s} \geq \sup \left\{ \int_G x(t) y(t) dt : y \in B(E^*_{\Phi, s}) \right\}.
\]

Put

\[
y_n(t) = \begin{cases} y(t), & |y(t)| \leq n \\ 0, & |y(t)| > n. \end{cases}
\]

Then \(y_n(t) \in B(E^*_{\Phi, s})\) and

\[
\int_G x(t) y(t) dt = \lim_{n \rightarrow \infty} \int_G x(t) y_n(t) dt.
\]

By the definition of “lim”, for any \(\epsilon > 0\), there exists \(n_0 \in N\) such that

\[
\int_G x(t) y(t) dt - \epsilon \leq \int_G x(t) y_n(t) dt,
\]

whenever \(n \geq n_0\). Thus

\[
\left\| x \right\|_{\Phi, s} - \epsilon \leq \int_G x(t) y(t) dt.
\]

Similarly, we can get \((1/h)(I_\Phi(hy_n')) - \left\| y_n' \right\|_{\Phi, s} \rightarrow 0(n \rightarrow \infty)\). Then \(\left\| x_n' + y_n' \right\|_{\Phi, s} \leq 2 - ((k + h)/kh)(s(2\delta/(1 + d)))\Phi(\sigma(2)/(\epsilon(2)))\) as \(n \rightarrow \infty\). By \(s(u) > 1\) when \(u > 0\), we have \(\lim_{n \rightarrow \infty} \left\| x_n' + y_n' \right\|_{\Phi, s} \leq 2\). The contradiction shows that \(kx_n' - hy_n' \rightarrow 0\).

Since \(s\)-norm is equivalent with the Luxemburg norm, their weak topology and weak star topology are all equivalent. Then \(L_{\Phi, s}\) is \(w^*\)-compact. Take \(\{x_n'\} \subset \{y_n'\}, \{y_n''\} \subset \{y_n'\}\) such that \(x_n' \rightarrow y'\) and \(y_n'' \rightarrow y''\). We can get \(x' + y'' = 2x_0\). By

\[
\left\| x \right\|_{\Phi, s} = \sup \left\{ \int_G x(t) y(t) dt : y \in B(L^*_{\Phi, s}) \right\},
\]

where \(B(L^*_{\Phi, s})\) represents the unit ball of the dual space of \(E_{\Phi, s}\), and

\[
\left\| x \right\|_{\Phi, s} \geq \sup \left\{ \int_G x(t) y(t) dt : y \in B(E^*_{\Phi, s}) \right\}.
\]

For any \(\epsilon > 0\), there exists \(y \in B(L^*_{\Phi, s})\) such that

\[
\left\| x \right\|_{\Phi, s} - \epsilon \leq \int_G x(t) y(t) dt.
\]

Put

\[
y_n(t) = \begin{cases} y(t), & |y(t)| \leq n \\ 0, & |y(t)| > n. \end{cases}
\]

Then \(y_n(t) \in B(E^*_{\Phi, s})\) and

\[
\int_G x(t) y(t) dt = \lim_{n \rightarrow \infty} \int_G x(t) y_n(t) dt.
\]

By the definition of “lim”, for any \(\epsilon > 0\), there exists \(n_0 \in N\) such that

\[
\int_G x(t) y(t) dt - \epsilon \leq \int_G x(t) y_n(t) dt,
\]

whenever \(n \geq n_0\). Thus

\[
\left\| x \right\|_{\Phi, s} - \epsilon \leq \int_G x(t) y_n(t) dt.
\]

By arbitrariness of \(\epsilon\) and combining with the above proof, we can obtain

\[
\left\| x \right\|_{\Phi, s} = \sup \left\{ \int_G x(t) y(t) dt : y \in B(E^*_{\Phi, s}) \right\}.
\]

Therefore

\[
2 = \left\| 2x_0 \right\|_{\Phi, s} = \left\| x' \right\|_{\Phi, s} + \left\| y' \right\|_{\Phi, s} \\
\leq \lim_{n \rightarrow \infty} \left\| x_n' \right\|_{\Phi, s} + \lim_{n \rightarrow \infty} \left\| y_n' \right\|_{\Phi, s} = 2.
\]

This shows \(\left\| x' \right\|_{\Phi, s} = \left\| y' \right\|_{\Phi, s} = 1\).

As we know \(2x_0 = x' + y'\); then \(k(2x_0 - y') = hy' \rightarrow 0\). It implies that \(k(2x_0 - y') = hy' \rightarrow 0\). Combining with the proof
above $y_n' \xrightarrow{\mu} y'$ and $\|y'\|_{\Phi_{\Delta_2}} = 1$, we have $y' = (2k/(k+h))x_0$.

As a result, $2k = k + h$. So $k = h$. We have $x_n' - y_n' \xrightarrow{\mu} 0$ as $n \to \infty$. Namely,

$$2(x_n' - x_0) = x_n' - y_n' \xrightarrow{\mu} 0 \quad (n \to \infty).$$

(57)

By the proof above, we get $1 < k_0 = k$; thus

$$k_n'x_n - k_0x_0 \xrightarrow{\mu} 0 \quad (n \to \infty).$$

(58)

Step 3. We will show that $I_{\Phi}(k_n'x_n) \to I_{\Phi}(k_0x_0)$. In fact

$$s(I_{\Phi}(k_0x_0)) = k_0,$$

$$s(I_{\Phi}(k_n'x_n)) \to k \quad (n \to \infty),$$

so $s(I_{\Phi}(k_n'x_n)) \to s(I_{\Phi}(k_0x_0))(n \to \infty)$. By the fact that $s(u) > 1$ and $s(u) - 1 > 0$, now $s(u)$ is strictly monotonous on $[u, +\infty)$. Hence, we have

$$I_{\Phi}(k_n'x_n) \to I_{\Phi}(k_0x_0) \quad (n \to \infty).$$

(60)

\[ \Box \]

**Corollary 10.** Let $s(u) > 1$ with $u > 0$ and $\Phi$ be an Orlicz function. $L_{\Phi,1}$ is middle point locally uniformly convex if and only if $\Phi \in \Delta_2$ and $L_{\Phi,\Delta}$ is strictly convex.
