The robust stability analysis problem is investigated for a class of Markovian jumping genetic regulatory networks with parameter uncertainties and mode-dependent delays, which varies randomly according to the Markov state and exists in both translation and feedback regulation processes. The purpose of the addressed stability analysis problem is to establish some easily verifiable conditions under which the Markovian jumping genetic regulatory networks with parameter uncertainties and mode-dependent delays is asymptotically stable. By utilizing a new Lyapunov functional and a lemma, we derive delay-dependent sufficient conditions ensuring the robust stability of the gene regulatory networks in the form of linear matrix inequalities. Illustrative examples are exploited to show the effectiveness of the derived linear-matrix-inequalities- (LMIS-) based stability conditions.

1. Introduction

In the past few years, genetic regulatory networks (GRNs) have been playing more and more important role in biological and biomedical sciences. With the study of genetic regulatory networks, scientists can gain insight into the underlying process of living systems at the molecular level; the dynamic behaviors of the GRNs in living organisms have received increasing attentions in the past decade [1–9].

Generally, GRNs can be described by two types of models, the Boolean networks models [10–12] and differential equation models [13–17]. Recently, the differential models have received an increasing amount of research attention since it can be provide detailed understanding of the nonlinear behavior exhibited by biological systems. Hence, our present
research further examines the differential GRN models with both mode-dependent time delays and Markovian jumping parameters.

Time delays are inevitably occurred due to the slow processes of transcription, translation, and translocation or the finite switching speed of amplifiers. The theoretical models without consideration of time delays may provide wrong predictions [15, 18]. The stability problem of genetic regulatory network with time delays has been investigated by many researches [15, 19–24]. For instance, Chen and Aihara [15] presented a different equation model for GRNs with constant time delays and proposed necessary and sufficient conditions for such GRNs. Ren and Cao [22] derived delay-dependent robust asymptotic stability criteria for a class of genetic regulatory networks with time-varying delays and parameter uncertainties. Wang et al. [24] developed a model for genetic regulatory networks with polytopic parameter uncertainties and derived delay-dependent stability criteria for such network. Moreover, due to the modeling inaccuracies and changes in the environment of the model, parameter uncertainties can be often encountered in the genetic regulatory networks. Therefore, the problem of robust stability analysis for uncertain GRNs emerges as a research topic of primary importance.

On the other hand, as shown in [25, 26], GRNs with Markovian jump parameters are a system with transitions among the states governed by a Markov chain taking values in a finite set. Therefore, it is of significance to model genetic regulatory networks with hybrid system. Recently, Hybrid system with time-varying delays has received increasing attention [27, 28]. Specially, the stability of Markovian genetic regulatory networks, which are subject to mode switching (or jumping), has been thoroughly investigated in [25, 26]. It should be pointed out that the delays in [25, 26] were a deterministic case. Ribeiro et al. [29] has pointed out that the transmission delay may occur randomly in GRNs and their probabilistic characteristics can often be obtained by statistical methods.

However, most of the reported works focus on the effect of a deterministic time delay case for the Markovian jumping genetic regulatory networks; a very few studies on the effect of stochastic delays have been reported.

In this paper, firstly, we deal with the stability problem of Markovian jumping genetic regulatory networks with mode-dependent delays, that is, the delay varies randomly according to the Markov state. Then, the results are extended to an uncertain case. By utilizing a new Lyapunov-Krasovskii function and a novel lemma, we derive new delay-dependent stability criteria in the form of linear matrix inequalities (LMIs), which can be easily checked by LMI Toolbox. Finally, two numerical examples are provided to show the effectiveness of the results.

Notations 1. Throughout this paper, $\mathbb{R}^n$ and $\mathbb{R}^{n \times m}$ denote, respectively, $n$-dimensional Euclidean space and the set of all $n \times m$ real matrices. The superscript “$T$” denotes the matrix transposition and the notation $X \geq Y$ (resp., $X > Y$) where $X$ and $Y$ are symmetric matrices, which means that $X - Y$ is a positive semidefinite (resp., positive definite) matrix, $I$ is the $n \times n$ identity matrix, and $\lambda_{\max}(A)$ (resp., $\lambda_{\min}(A)$) represents the largest (resp., smallest) eigenvalue of matrix $A$. For symmetric block matrices or long matrix expressions, an asterisk $*$ is used to represent a term that is induced by symmetry. Let $h > 0$, and $C([-h, 0; \mathbb{R}^n])$ denote the family of continuous functions $\phi$ from $[-h, 0]$ to $\mathbb{R}^n$ with the norm $\|\phi\| = \sup_{t \in [-h, 0]} |\phi(t)|$, where $|\cdot|$ is the Euclidean norm in $\mathbb{R}^n$; $\mathbb{E}[\cdot]$ stands for the mathematical expectation operator. Let $(\Omega, \mathcal{F}, \{\mathcal{F}_t\}_{t \geq 0}, P)$ be a complete probability space with a filtration $\{\mathcal{F}_t\}_{t \geq 0}$ satisfying the usual conditions (i.e., the filtration contains all $P$-null sets and is right continuous). Denote
by $L^p_{F_t}([-h,0];\mathbb{R}^n)$ the family of all $\mathcal{F}_t$-measurable $C([-h,0];\mathbb{R}^n)$-valued random variables $\xi = \{\xi(\theta) : -h \leq \theta \leq 0\}$ such that $\sup_{-h\leq\theta\leq 0}\mathbb{E}|\xi(\theta)|^p < \infty$.

2. Model Description

In this paper, we will consider the following genetic regulatory networks [25]:

\[
\begin{align*}
\dot{m}(t) &= -Am(t) + Bf(p(t - \sigma(t))) + L, \\
\dot{p}(t) &= -Cp(t) + Dm(t - \tau(t)),
\end{align*}
\]

where $m(t) = [m_1(t), m_2(t), \ldots, m_n(t)]^T$, $p(t) = [p_1(t), p_2(t), \ldots, p_n(t)]^T$, and $m_i(t)$ and $p_i(t)$ are the concentrations of mRNA and protein of the $i$th node at time $t$, respectively; $A = \text{diag}(a_1, a_2, \ldots, a_n)$ and $C = \text{diag}(c_1, c_2, \ldots, c_n)$ denote the degradation or dilution rates of mRNAs and proteins, $D = \text{diag}(d_1, d_2, \ldots, d_n)$ represents the translation rate, and $B = (b_{ij}) \in \mathbb{R}^{n \times n}$ is defined as follows:

\[
b_{ij} = \begin{cases} 
> 0 & \text{if transcription } j \text{ is an activator of gene } i; \\
0 & \text{if there is no link from node } j \text{ to } i; \\
< 0 & \text{if transcription } j \text{ is an repressor of gene } i; 
\end{cases}
\]

$f(\cdot)$ denotes the feedback regulation of the protein on the transcription, which is the monotonic function in Hill form, $f_i(x) = x^{h_i}/(1 + x^{h_i})$, and $h_i$ is the Hill coefficient; $\tau(t)$ and $\sigma(t)$ are the time delays; $L = [l_1, l_2, \ldots, l_n]^T$, $l_i$ is the base transcriptional rate of the repressor of gene $i$. Assume $m^*$ and $p^*$ are the equilibrium points of (2.1), defining $x(t) = m(t) - m^*$, $y(t) = p(t) - p^*$, it is easy to get

\[
\begin{align*}
\dot{x}(t) &= -Ax(t) + Bg(y(t - \sigma(t))), \\
\dot{y}(t) &= -Cy(t) + Dx(t - \tau(t)),
\end{align*}
\]

where $g(y(t)) = f(y(t) + p^*) - f(p^*)$, from the definition of $g$, it is easy to get

\[
g(x)(g(x) - Kx) \leq 0. \tag{2.4}
\]

Taking the Markovian jumping parameters and stochastic delays into account, a Markovian jumping genetic regulatory networks model with mode-dependent delays is considered as

\[
\begin{align*}
\dot{x}(t) &= -A(r(t))x(t) + B(r(t))g(y(t - \sigma_{r(t)}(t))), \\
\dot{y}(t) &= -C(r(t))y(t) + D(r(t))x(t - \tau_{r(t)}(t)),
\end{align*}
\]
where $r(t)$ is a continuous-time Markovian process with right continuous trajectories and taking values in a finite set $S = \{1, 2, \ldots, N\}$ with the following transition probabilities:

$$P\{r(t + \Delta t) = j : r(t) = i\} = \begin{cases} y_{ij} \Delta t + O(\Delta t) & \text{if } j \neq i, \\
1 + y_{ij} \Delta t + O(\Delta t) & \text{if } j = i, \end{cases}$$

(2.6)

where $\Delta t > 0$ and $\lim_{\Delta t \to 0} O(\Delta t) / \Delta t = 0$. Here, $y_{ij} \geq 0$ is the transition rate from $i$ to $j$ if $i \neq j$, while $y_{ii} = -\sum_{j=1, j \neq i}^N y_{ij}$.

$\tau_{r(i)}(t)$ and $\sigma_{r(i)}(t)$ are the time-varying delays when the mode is in $r(t)$ and we assume that they satisfy the following conditions

$$0 \leq d_{ii} \leq \tau_{i}(t) \leq d_{2i}, \quad \dot{\tau}_{i}(t) \leq h_{i}, \quad 0 \leq e_{1i} \leq \sigma_{i}(t) \leq e_{2i}, \quad \dot{\sigma}_{i}(t) \leq \mu_{i},$$

(2.7)

where $d_{ii}, d_{2i}, e_{1i}, e_{2i}, h_{i}$, and $\mu_{i}$ are known real constants, for any $i \in S$, denote

$$d_1 = \min\{d_{ii}, i \in S\}, \quad d_2 = \max\{d_{2i}, i \in S\}, \quad e_1 = \min\{e_{1i}, i \in S\}, \quad e_2 = \max\{e_{2i}, i \in S\}.$$  

(2.8)

**Remark 2.1.** In [25], $h_{i}$ and $\mu_{i}$ are assumed to be less than 1. But in practice, they are not always less than 1. In this paper, we develop the criteria without this restrict. In the following we will give some lemmas, which will play an indispensable role in deriving our criteria.

**Lemma 2.2** (see [24]). For any vector $x, y \in \mathbb{R}^n$ and matrix $Q > 0$, one has the following inequality:

$$2x^T y \leq x^T Qx + y^T Q^{-1} y.$$  

(2.9)

**Lemma 2.3** (see [30]). For any positive definite matrix $M > 0$, scalar $\gamma > 0$ and vector function $\omega : [0, \gamma] \to \mathbb{R}^n$ such that the integrations concerned are well defined, then the following inequality holds:

$$\left(\int_0^\gamma \omega(s)ds\right)^T M \left(\int_0^\gamma \omega(s)ds\right) \leq \gamma \left(\int_0^\gamma \omega^T(s) M \omega(s)ds\right).$$

(2.10)

**Lemma 2.4** (see [31]) (Schur complement). Given constant matrices $X, Y$, and $Z$ where $X = X^T$ and $0 < Y = Y^T$. Then $X + Z^T Y^{-1} Z < 0$ if and only if

$$\begin{bmatrix} X & Z^T \\ Z & -Y \end{bmatrix} < 0, \quad \text{or} \quad \begin{bmatrix} -Y & Z \\ Z^T & X \end{bmatrix} < 0.$$  

(2.11)

**Lemma 2.5** (see [32]). Assume $\Omega, X_1, \text{and } X_2$ are constant matrices with appropriate dimensions, $0 \leq \sigma(t) \leq 1$, then

$$\Omega - X_1 < 0,$$

$$\Omega - X_2 < 0,$$

(2.12)
is equivalent to

\[ \Omega - \alpha(t)X_1 - (1 - \alpha(t))X_2 < 0. \quad (2.13) \]

### 3. Main Results

In this section, we first deal with the asymptotical stability problem for the system (2.5). By employing a new Lyapunov-Krasovskii function, some less conservative sufficient criteria for the stability problem of Markovian jumping genetic regulatory networks with mode-dependent delays are derived in terms of LMIs. Then the results are extended to uncertain case.

**Theorem 3.1.** The genetic regulatory networks (2.5) is asymptotically stable, if there exist matrix sets \( \{P_i > 0, Q_i > 0, \forall i \in S\} \), matrices \( N_j, M_j \) \( (j = 1, 2, 3) > 0 \) \( R_j \) \( (j = 1, 2, 3, 4) > 0 \), any diagonal positive definite matrix \( \Lambda \), and any matrices \( U, V \) with appropriate dimensions such that the following LMIs hold:

\[
\begin{align*}
\Omega_{11} - e_1^T R_1 e_1 - e_2^T R_2 e_1 &< 0, \\
\Omega_{11} - e_2^T R_1 e_1 - e_3^T R_2 e_3 &< 0, \\
\Omega_{11} - e_3^T R_1 e_2 - e_1^T R_2 e_1 &< 0, \\
\Omega_{11} - e_2^T R_1 e_2 - e_3^T R_2 e_3 &< 0, \\
\Omega_{21} - e_4^T R_3 e_4 - e_1^T R_4 e_4 &< 0, \\
\Omega_{21} - e_4^T R_3 e_4 - e_6^T R_4 e_6 &< 0, \\
\Omega_{21} - e_5^T R_3 e_5 - e_1^T R_4 e_4 &< 0, \\
\Omega_{21} - e_5^T R_3 e_5 - e_6^T R_4 e_6 &< 0,
\end{align*}
\]

where

\[
\Omega_{11} = \begin{bmatrix}
\Xi_1 & R_1 & 0 & 0 & -UA_1 \\
* & \Xi_2 & R_2 & R_2 + R_1 - \frac{d_1 R_2}{\delta_2} & 0 \\
* & * & -R_2 - N_1 & 0 & 0 \\
* & * & * & -R_1 - R_2 - N_2 + \frac{d_1 R_2}{\delta_2} & 0 \\
* & * & * & * & \Xi_3
\end{bmatrix},
\]

and

\[
\begin{align*}
e_1 &= [0 \; I \; 0 \; -I \; 0], & e_2 &= [I \; -I \; 0 \; 0 \; 0], & e_3 &= [0 \; -I \; I \; 0 \; 0], \\
e_4 &= [0 \; I \; 0 \; -I \; 0], & e_5 &= [I \; -I \; 0 \; 0 \; 0], & e_6 &= [0 \; -I \; I \; 0 \; 0].
\end{align*}
\]
Proof. Choose a Lyapunov-Krasovskii functional candidate:

\[
\Omega_{2i} = \begin{bmatrix}
\Pi_1 & R_3 & 0 & 0 & -VC_i & 0 \\
* & \Pi_2 & R_4 & R_3 + R_4 - \frac{e_1 R_4}{e_2} & 0 & \Lambda \\
* & * & -R_4 - M_1 & 0 & 0 & 0 \\
* & * & * & -R_3 - R_4 - M_2 + \frac{e_1 R_4}{e_2} & 0 & 0 \\
* & * & * & * & \Pi_3 & 0 \\
* & * & * & * & * & \Pi_4
\end{bmatrix},
\]

\[
\Xi_1 = -P_i A_i - A_i^T P_i + \sum_{j=1}^{N} \gamma_{ij} P_j + \sum_{j=1}^{3} N_j - \gamma_{ii} (d_2 - d_1) N_3 - R_1 + P_i,
\]

\[
\Xi_2 = -(1 - h_i) N_3 - 2R_1 - 2R_2 + D_i^T V D_i + D_i^T Q_i D_i + \frac{d_i R_2}{d_2},
\]

\[
\Xi_3 = -U + e_2^2 R_1 + (d_2 - d_1)^2 R_2,
\]

\[
\Pi_1 = -Q_i C_i - C_i^T Q_i + \sum_{j=1}^{N} \gamma_{ij} Q_j + \sum_{j=1}^{3} M_j - \gamma_{ii} (e_2 - e_1) M_3 - R_3 + Q_i,
\]

\[
\Pi_2 = -(1 - \mu_i) M_3 - 2R_3 - 2R_4 + \frac{e_1 R_4}{e_2},
\]

\[
\Pi_3 = -V + e_2^2 R_3 + (e_2 - e_1)^2 R_4,
\]

\[
\Pi_4 = -2\Lambda K^{-1} + B_i^T U B_i + B_i^T P_i B_i.
\]

(3.2)

\[
V(i, t, x(t), y(t)) = V_1(i, t, x(t), y(t)) + V_2(i, t, x(t), y(t)) + V_3(i, t, x(t), y(t)) + V_4(i, t, x(t), y(t)),
\]

(3.3)

where

\[
V_1(i, t, x(t), y(t)) = x^T(t) P_i x(t) + y^T(t) Q_i y(t),
\]

\[
V_2(i, t, x(t), y(t)) = \sum_{j=1}^{2} \int_{t-d_j}^{t} x^T(s) N_j x(s) ds + \sum_{j=1}^{2} \int_{t-e_j}^{t} y^T(s) M_j y(s) ds \\
+ \int_{t-\tau_i(t)}^{t} x^T(s) N_3 x(s) ds + \int_{t-\sigma_i(t)}^{t} y^T(s) M_3 y(s) ds,
\]
\[ V_3(i, t, x(t), y(t)) = -\gamma_i \int_{-d_i}^{-\epsilon_i} t \mathbf{x}(s) N_3 \mathbf{x}(s) ds \ d\theta - \gamma_i \int_{-\epsilon_i}^{l} t \mathbf{y}(s) M_3 \mathbf{y}(s) ds \ d\theta, \]
\[ V_4(i, t, x(t), y(t)) = d_2 \int_{-d_z}^{l} \int_{-\epsilon_z}^{l} t \mathbf{x}(s) R_1 \mathbf{x}(s) ds \ d\theta + (d_2 - d_1) \int_{-d_z}^{l} \int_{-\epsilon_z}^{l} t \mathbf{x}(s) R_2 \mathbf{x}(s) ds \ d\theta \]
\[ + e_2 \int_{-\epsilon_z}^{l} \int_{-\epsilon_z}^{l} t \mathbf{y}(s) R_3 \mathbf{y}(s) ds \ d\theta + (e_2 - e_1) \int_{-\epsilon_z}^{l} \int_{-\epsilon_z}^{l} t \mathbf{y}(s) R_4 \mathbf{y}(s) ds \ d\theta. \]

Let \( \mathcal{L} \) be the weak infinite generator. Then for each \( r(t) = i, i \in S \) along the trajectory of (2.5) one has
\[
\mathcal{L}V_1(i, t, x(t), y(t)) = 2x^T(t)P_1(-A_i x(t) + B_i g(y(t - \sigma_i(t)))) + \sum_{j=1}^{N} \gamma_{ij} x^T(t)P_j x(t) + 2y^T(t)Q_i(-C_i y(t) + D_i x(t - \tau_i(t))) + \sum_{j=1}^{N} \gamma_{ij} y^T(t)Q_j y(t),
\]
\[
\mathcal{L}V_2(i, t, x(t), y(t)) \leq \sum_{j=1}^{N} x^T(t)N_j x(t) - (1 - h_i)x^T(t - \tau_i(t)) N_3 x(t - \tau_i(t))
\]
\[
+ 3 \sum_{j=1}^{N} y^T(t)M_j y(t) - (1 - \mu_i)y^T(t - \sigma_i(t)) M_3 y(t - \sigma_i(t))
\]
\[
- \frac{2}{\epsilon_j} x^T(t - d_j) N_j x(t - d_j) - \frac{2}{\epsilon_j} y^T(t - e_j) M_j y(t - e_j)
\]
\[
+ \sum_{j=1}^{N} \gamma_{ij} \int_{t-\tau_i(t)}^{l} x^T(s)N_3 x(s) ds + \sum_{j=1}^{N} \gamma_{ij} \int_{t-\sigma_i(t)}^{l} y^T(s)M_3 y(s) ds,
\]
\[
\sum_{j=1}^{N} \gamma_{ij} \int_{t-\tau_i(t)}^{l} x^T(s)N_3 x(s) ds = \gamma_{ii} \int_{t-\tau_i(t)}^{l} x^T(s)N_3 x(s) ds + \sum_{j \neq i}^{N} \gamma_{ij} \int_{t-\tau_i(t)}^{l} x^T(s)N_3 x(s) ds
\]
\[
\leq \gamma_{ii} \int_{t-d_i}^{l} x^T(s)N_3 x(s) ds + \sum_{j \neq i}^{N} \gamma_{ij} \int_{t-d_i}^{l} x^T(s)N_3 x(s) ds
\]
\[
= \gamma_{ii} \int_{t-d_i}^{l} x^T(s)N_3 x(s) ds - \gamma_{ii} \int_{t-d_i}^{l} x^T(s)N_3 x(s) ds
\]
\[
= - \gamma_{ii} \int_{t-d_i}^{l-d_i} x^T(s)N_3 x(s) ds.
\]
Similarly

\[ \sum_{j=1}^{N} \gamma_{ij} \int_{t-\tau_1(t)}^{t} y^T(s) M_3 y(s) \, ds \leq -\gamma_i \int_{t-e_1}^{t-d_1} y^T(s) M_3 y(s) \, ds, \]

\[ \mathcal{L} V_3(i, t, x(t), y(t)) = -\gamma_i (d_2 - d_1) x^T(t) N_3 x(t) + \gamma_i \int_{t-d_1}^{t-d_2} x^T(s) N_3 x(s) \, ds \]

\[ -\gamma_i (e_2 - e_1) y^T(t) M_3 y(t) + \gamma_i \int_{t-e_1}^{t-e_2} y^T(s) M_3 y(s) \, ds, \]

\[ \mathcal{L} V_4(i, t, x(t), y(t)) = d_2 x^T(t) R_1 \dot{x}(t) - d_2 \int_{t-d_2}^{t} x^T(s) R_1 \dot{x}(s) \, ds + (d_2 - d_1) x^T(t) R_2 \dot{x}(t) \]

\[ + (e_2 - e_1)^2 y^T(t) R_4 y(t) \, ds - e_2 \int_{t-e_2}^{t} y^T(s) R_3 y(s) \, ds + e_2^2 y^T(t) R_3 y(t) \]

\[ - (d_2 - d_1) \int_{t-d_2}^{t-d_1} x^T(s) R_2 \dot{x}(s) \, ds - (e_2 - e_1) \int_{t-e_2}^{t-e_1} y^T(s) R_4 y(s) \, ds. \]

Note that

\[ -d_2 \int_{t-d_2}^{t} x^T(s) R_1 \dot{x}(s) \, ds = -d_2 \int_{t-d_2}^{t-d_1} x^T(s) R_1 \dot{x}(s) \, ds - d_2 \int_{t-d_1}^{t} x^T(s) R_1 \dot{x}(s) \, ds \]

\[ = -(d_2 - \tau_1(t)) \int_{t-d_2}^{t-d_1} x^T(s) R_1 \dot{x}(s) \, ds - \tau_1(t) \int_{t-d_1}^{t-d_2} x^T(s) R_1 \dot{x}(s) \, ds \]

\[ \leq -x^T(t - \tau_1(t)) R_1 x(t - \tau_1(t)) + 2x^T(t - \tau_1(t)) R_1 x(t - d_2) - x^T(t - d_2) R_1 x(t - d_2) \]

\[ - x^T(t) R_1 x(t) + 2x^T(t) R_1 x(t - \tau_1(t)) - x^T(t - \tau_1(t)) R_1 x(t - \tau_1(t)) \]

\[ - \left[ \frac{\tau_1(t)}{d_2 - \tau_1(t)} \right] x^T(t - \tau_1(t)) - x^T(t - d_2) \left[ R_1 [x(t - \tau_1(t)) - x(t - d_2)] \right] \]

\[ - \left[ \frac{d_2 - \tau_1(t)}{\tau_1(t)} \right] x^T(t - \tau_1(t)) - x^T(t - \tau_1(t)) \left[ R_1 [x(t) - x(t - \tau_1(t))] \right] \]

\[ \leq -x^T(t - \tau_1(t)) R_1 x(t - \tau_1(t)) + 2x^T(t - \tau_1(t)) R_1 x(t - d_2) - x^T(t - d_2) R_1 x(t - d_2) \]

\[ - x^T(t) R_1 x(t) + 2x^T(t) R_1 x(t - \tau_1(t)) - x^T(t - \tau_1(t)) R_1 x(t - \tau_1(t)) \]
\[-\left(\frac{\tau_i(t)}{d_2}\right)
\begin{align*}
&\left[x^T(t-\tau_i(t)) - x^T(t-d_2)\right]R_1[x(t-\tau_i(t)) - x(t-d_2)] \\
&- \left[1 - \left(\frac{\tau_i(t)}{d_2}\right)\right]\left[x^T(t) - x^T(t-\tau_i(t))\right]R_1[x(t) - x(t-\tau_i(t))].
\end{align*}
\] (3.7)

Similarly,
\[-(d_2 - d_1) \int_{t-d_2}^{t-d_1}x^T(s)R_2\dot{x}(s)ds
\leq -x^T(t-\tau_i(t))R_2x(t-\tau_i(t)) + 2x^T(t-\tau_i(t))R_2x(t-d_2) - x^T(t-d_2)R_2x(t-d_2)
\]
\[-x^T(t-d_1)R_2x(t-d_1) + 2x^T(t-d_1)R_2x(t-\tau_i(t)) - x^T(t-\tau_i(t))R_2x(t-\tau_i(t))
\]
\[+ \left(\frac{d_1}{d_2}\right)[x^T(t-\tau_i(t)) - x^T(t-d_2)]R_2[x(t-\tau_i(t)) - x(t-d_2)]
\]
\[-\left(\frac{\tau_i(t)}{d_2}\right)[x^T(t-\tau_i(t)) - x^T(t-d_2)]R_2[x(t-\tau_i(t)) - x(t-d_2)]
\]
\[-\left[1 - \left(\frac{\tau_i(t)}{d_2}\right)\right]\left[x^T(t-d_1) - x^T(t-\tau_i(t))\right]R_2[x(t-d_1) - x(t-\tau_i(t))],
\]
\[-e_2\int_{t-e_2}^{t}y^T(s)R_3y(s)ds
\leq -y^T(t-\sigma_i(t))R_3y(t-\sigma_i(t)) + 2y^T(t-\sigma_i(t))R_3y(t-e_2) - y^T(t-e_2)R_3y(t-e_2)
\]
\[-y^T(t)R_3y(t) + 2y^T(t)R_3y(t-\sigma_i(t)) - y^T(t-\sigma_i(t))R_3y(t-\sigma_i(t))
\]
\[-\left[\frac{\sigma_i(t)}{e_2}\right][y^T(t-\sigma_i(t)) - y^T(t-e_2)]R_3[y(t-\sigma_i(t)) - y(t-e_2)]
\]
\[-\left[1 - \left(\frac{\sigma_i(t)}{e_2}\right)\right][y^T(t) - y^T(t-\sigma_i(t))]R_3[y(t) - y(t-\sigma_i(t))],
\]
\[-(e_2 - e_1)\int_{t-e_2}^{t-e_1}y^T(s)R_4\dot{y}(s)ds
\leq -y^T(t-\sigma_i(t))R_4y(t-\sigma_i(t)) + 2y^T(t-\sigma_i(t))R_4y(t-e_2) - y^T(t-e_2)R_4y(t-e_2)
\]
\[-y^T(t-e_1)R_4y(t-e_1) + 2y^T(t-e_1)R_4y(t-\sigma_i(t)) - y^T(t-\sigma_i(t))R_4y(t-\sigma_i(t))
\]
\[+ \left(\frac{e_1}{e_2}\right)[y^T(t-\sigma_i(t)) - y^T(t-e_2)]R_4[y(t-\sigma_i(t)) - y(t-e_2)]
\]
\[-\left(\frac{\sigma_i(t)}{e_2}\right)[y^T(t-\sigma_i(t)) - y^T(t-e_2)]R_4[y(t-\sigma_i(t)) - y(t-e_2)]
\]
\[-\left[1 - \left(\frac{\sigma_i(t)}{e_2}\right)\right][y^T(t-e_1) - y^T(t-\sigma_i(t))]R_4[y(t-e_1) - y(t-\sigma_i(t))].
\]
Noting the sector condition (2.4), for any positive matrix $\Lambda$ we have

$$2y^T(t - \sigma_i(t)) \Lambda g(y(t - \sigma_i(t))) - 2g^T(y(t - \sigma_i(t))) \Lambda K^{-1} g(y(t - \sigma_i(t))) \geq 0. \quad (3.9)$$

For any matrices $U$ and $V$ with appropriate dimensions, we have

$$-2\dot{x}^T(t) U [\dot{x}(t) + A_i x(t) - B_i g(y(t - \sigma_i(t)))] = 0,$$
$$-2\dot{y}^T(t) V [\dot{y}(t) + C_i y(t) - D_i x(t - \tau_i(t))] = 0. \quad (3.10)$$

By Lemma 2.3 we can get the following inequalities:

$$2x^T(t) B_i g(y(t - \sigma_i(t))) \leq x^T(t) P x(t) + g^T(y(t - \sigma_i(t))) B_i^T P B_i g(y(t - \sigma_i(t))),$$
$$2y^T(t) Q D_i x(t - \tau_i(t)) \leq y^T(t) Q y(t) + x^T(t - \tau_i(t)) D_i^T Q D_i x(t - \tau_i(t)),$$
$$2\dot{x}^T(t) U B_i g(y(t - \sigma_i(t))) \leq \dot{x}^T(t) U \dot{x}(t) + g^T(y(t - \sigma_i(t))) B_i^T U B_i g(y(t - \sigma_i(t))),$$
$$2\dot{y}^T(t) V D_i x(t - \tau_i(t)) \leq \dot{y}^T(t) V \dot{y}(t) + x^T(t - \tau_i(t)) D_i^T V D_i x(t - \tau_i(t)). \quad (3.11)$$

From (3.3) to (3.11) we can get

$$\mathcal{L} V(i, t, x(t), y(t)) \leq \xi^T(t) \Omega_i \xi(t) - \left( \frac{\tau_i(t)}{d_2} \right) \xi^T(t) e^T_1 R_1 e_1 \xi(t) - \left[ 1 - \left( \frac{\tau_i(t)}{d_2} \right) \right] \xi^T(t) e^T_2 R_2 e_2 \xi(t)$$
$$+ \left( \frac{\tau_i(t)}{d_2} \right) \xi^T(t) e^T_3 R_3 e_3 \xi(t) - \left[ 1 - \left( \frac{\tau_i(t)}{d_2} \right) \right] \xi^T(t) e^T_4 R_4 e_4 \xi(t)$$
$$- \left( \frac{\sigma_i(t)}{d_2} \right) \eta^T(t) e^T_1 R_5 e_5 \eta(t) - \left[ 1 - \left( \frac{\sigma_i(t)}{d_2} \right) \right] \eta^T(t) e^T_2 R_6 e_6 \eta(t), \quad (3.12)$$

where

$$\xi(t) = \begin{bmatrix} x^T(t), x^T(t - \tau_i(t)), x^T(t - d_1), x^T(t - d_2), \dot{x}^T(t) \end{bmatrix}^T,$$
$$\eta(t) = \begin{bmatrix} y^T(t), y^T(t - \sigma_i(t)), y^T(t - e_1), y^T(t - e_2), \dot{y}^T(t), g^T(y(t - \sigma_i(t))) \end{bmatrix}^T. \quad (3.13)$$

By Lemma 2.5, (3.12) < 0 is equivalent to (3.1). Then by the Lyapunov-Krasovskii stability theorem that the genetic regulatory networks (2.5) is asymptotically stable in the mean square. Hence, this completes the proof. \qed
Remark 3.3. The genetic regulatory networks (2.5) is asymptotically stable, if there exist matrix sets \( \{ P_i > 0, Q_i > 0, \forall i \in S \} \), matrices \( N_j, \ M_j \ (j = 1, 2, 3) > 0 \ R_j \ (j = 1, 2, 3, 4) > 0 \), any diagonal positive definite matrix \( \Lambda \), and any matrices \( U \) and \( V \) with appropriate dimensions such that the following LMIs hold:

\[
\Omega_{1i} < 0, \quad \Omega_{2i} < 0, \tag{3.15}
\]

where, \( \Omega_{1i} \) and \( \Omega_{2i} \) are defined in Theorem 3.1.

Remark 3.3. In the proof of Theorem 3.1, if we ignore the terms \( -(\tau_j(t)/d_j)\xi^T(t)e_j^T R_1 e_j \xi(t), \) \( -[1 - (\tau_j(t)/d_j)]\zeta^T(t)e_j^T R_1 e_j \zeta(t), \) \( -(\sigma_j(t)/\epsilon_j)\eta^T(t)e_j^T R_3 e_j \eta(t), \) \( -[1 - (\sigma_j(t)/\epsilon_j)]\eta^T(t)e_j^T R_3 e_j \eta(t), \) \( -(\tau_j(t)/d_j)\zeta^T(t)e_j^T R_1 e_j \zeta(t), \) \( -[1 - (\tau_j(t)/d_j)]\zeta^T(t)e_j^T R_1 e_j \zeta(t), \) \( -(\sigma_j(t)/\epsilon_j)\eta^T(t)e_j^T R_3 e_j \eta(t), \) \( -[1 - (\sigma_j(t)/\epsilon_j)]\eta^T(t)e_j^T R_3 e_j \eta(t), \) we can also get sufficient conditions ensuring the robust stability of the genetic regulatory networks. But the conditions are conservative to some extent. By considering the terms \( -(\tau_j(t)/d_j)\xi^T(t)e_j^T R_1 e_j \xi(t), \) \( -[1 - (\tau_j(t)/d_j)]\zeta^T(t)e_j^T R_1 e_j \zeta(t), \) \( -(\sigma_j(t)/\epsilon_j)\eta^T(t)e_j^T R_3 e_j \eta(t), \) \( -[1 - (\sigma_j(t)/\epsilon_j)]\eta^T(t)e_j^T R_3 e_j \eta(t), \) we can get a less conservative criterion. The illustrate examples will show this in Section 4.
In the following, we will extend our results to uncertain case. We consider the following Markovian jumping genetic regulatory networks with mode-dependent delays and parameter uncertainties:

\[
\begin{align*}
\dot{x}(t) &= -(A_i + \Delta A_i)x(t) + (B_i + \Delta B_i)g(y(t - \sigma_i(t))), \\
\dot{y}(t) &= -(C_i + \Delta C_i)y(t) + (D_i + \Delta D_i)x(t - \tau_i(t)),
\end{align*}
\]

(3.16)

where \(\Delta A_i, \Delta B_i, \Delta C_i, \) and \(\Delta D_i\) are the parametric uncertainties satisfying:

\[
[\Delta A_i, \Delta B_i, \Delta C_i, \Delta D_i] = E_i F_i [H_{ai}, H_{bi}, H_{ci}, H_{di}].
\]

(3.17)

\(E_i, H_{ai}, H_{bi}, H_{ci},\) and \(H_{di}\) are the known real constant matrices with appropriate dimensions, \(F_i\) satisfies

\[
F_i^T F_i \leq I, \quad i \in S.
\]

(3.18)

**Theorem 3.4.** The genetic regulatory networks (3.16) is robust asymptotically stable, if there exist \(P_1 > 0, P_2 > 0, \ldots, P_n > 0, Q_1 > 0, Q_2 > 0, \ldots, Q_n > 0, N_j, M_j (j = 1, 2, 3) > 0, R_j (j = 1, 2, 3, 4) > 0,\) real number \(\{\varepsilon_i, i \in S\}\), any diagonal positive definite matrix \(\Lambda\), and any matrices \(U\) and \(V\) with appropriate dimensions such that the following LMIs hold:

\[
\begin{align*}
\bar{Q}_{ii1} - \varepsilon_i^T R_1 \varepsilon_1 - \varepsilon_i^T R_2 \varepsilon_1 &< 0, \\
\bar{Q}_{ii1} - \varepsilon_i^T R_1 \varepsilon_1 - \varepsilon_i^T R_3 \varepsilon_3 &< 0, \\
\bar{Q}_{ii1} - \varepsilon_i^T R_1 \varepsilon_2 - \varepsilon_i^T R_2 \varepsilon_1 &< 0, \\
\bar{Q}_{ii1} - \varepsilon_i^T R_2 \varepsilon_1 - \varepsilon_i^T R_3 \varepsilon_3 &< 0, \\
\bar{Q}_{ii2} - \varepsilon_i^T R_3 \varepsilon_4 - \varepsilon_i^T R_4 \varepsilon_4 &< 0, \\
\bar{Q}_{ii2} - \varepsilon_i^T R_3 \varepsilon_4 - \varepsilon_i^T R_4 \varepsilon_6 &< 0, \\
\bar{Q}_{ii2} - \varepsilon_i^T R_5 \varepsilon_5 - \varepsilon_i^T R_4 \varepsilon_4 &< 0, \\
\bar{Q}_{ii2} - \varepsilon_i^T R_5 \varepsilon_5 - \varepsilon_i^T R_4 \varepsilon_6 &< 0,
\end{align*}
\]

(3.19)

where

\[
\bar{\Omega}_{1i} = \begin{bmatrix}
\Gamma_{1i} & \phi_{1i} \\
\ast & \ast
\end{bmatrix}, \quad \bar{\Omega}_{2i} = \begin{bmatrix}
\Gamma_{2i} & \phi_{2i} \\
\ast & \ast
\end{bmatrix},
\]

\[
\begin{align*}
\Xi_1 &= \begin{bmatrix}
R_1 & 0 & 0 & -UA_i \\
0 & R_2 & R_2 + R_1 - \frac{d_1 R_2}{d_2} & 0 \\
0 & \ast & -R_2 - N_1 & 0 \\
0 & \ast & \ast & -R_1 - R_2 - N_2 + \frac{d_1 R_2}{d_2} \\
0 & \ast & \ast & \ast
\end{bmatrix}, \\
\Xi_2 &= \begin{bmatrix}
\varepsilon_1 \\
\varepsilon_2 \\
\varepsilon_3 \\
\varepsilon_4 \\
\varepsilon_5
\end{bmatrix}, \\
\Xi_3 &= \begin{bmatrix}
\varepsilon_1 \\
\varepsilon_2 \\
\varepsilon_3 \\
\varepsilon_4 \\
\varepsilon_5
\end{bmatrix},
\end{align*}
\]

\[
\Xi_1 = -P_i A_i - A_i^T P_i + \sum_{i=1}^N \gamma_i P_i + \sum_{j=1}^3 N_j - \gamma_i (d_2 - d_1) N_3 - R_1 + P_i + 2 \varepsilon_i H_{ai}^T H_{ai},
\]
\[ \Xi_2 = - (1 - h_i) N_3 - 2 R_1 - 2 R_2 + D_i^T V D_i + D_i^T Q_i D_i + 2 \varepsilon_i H_{i1}^T H_{i1} + \frac{d_1 R_2}{d_2}, \]

\[ \varphi_{1i} = \text{diag}(-\varepsilon_i I, -I, -I, -I), \]

\[ \phi_{1i} = \begin{bmatrix} \sqrt{2} P_i \varepsilon_i & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \sqrt{2} U E_i \end{bmatrix}, \]

\[ \bar{\Pi}_1 = R_3 \begin{bmatrix} \Pi_1 & R_3 & 0 & 0 \\ 0 & R_3 + R_4 & -\frac{e_1 R_4}{e_2} & 0 \\ -R_4 + M_1 & 0 & 0 \\ -R_3 - R_4 & -M_2 - \frac{e_1 R_4}{e_2} & 0 & 0 \end{bmatrix}, \]

\[ \phi_{2i} = \begin{bmatrix} \sqrt{2} Q_i \varepsilon_i & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \sqrt{2} V E_i \end{bmatrix}, \]

\[ \varphi_{2i} = \text{diag}(-\varepsilon_i I, -I, -I, -I, -I). \]

**Proof.** Consider the same Lyapunov-Krasovskii functional (3.3), do the differential along the trajectory (3.16), one can readily get

\[ \mathcal{L} V (i, x(t), y(t)) \leq \bar{\xi}^T \bar{\Pi}_i \bar{\xi}(t) - \left( \frac{\tau_i(t)}{d_2} \right) \bar{\xi}^T(t) \varepsilon_1 \varepsilon_1 \bar{\xi}(t) - \left[ 1 - \left( \frac{\tau_i(t)}{d_2} \right) \right] \bar{\xi}^T(t) \varepsilon_2 \varepsilon_2 \bar{\xi}(t) \]

\[ \leq \left( \frac{\tau_i(t)}{d_2} \right) \bar{\xi}^T(t) \varepsilon_1 \varepsilon_1 \bar{\xi}(t) - \left[ 1 - \left( \frac{\tau_i(t)}{d_2} \right) \right] \bar{\xi}^T(t) \varepsilon_3 \varepsilon_3 \bar{\xi}(t) \]

(3.20)
In this section, two numerical examples are given to illustrate the effectiveness of the derived results.

**Example 4.1.** Consider (2.5) where

\[
A_1 = \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}, \quad B_1 = \begin{bmatrix} 1 & -2 \\ 0.8 & 0 \end{bmatrix}, \quad C_1 = \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}, \quad D_1 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix},
\]
\[
A_2 = \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}, \quad B_2 = \begin{bmatrix} -1 & 0 \\ 1 & 2 \end{bmatrix}, \quad C_2 = \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}, \quad D_2 = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}.
\]

The nonlinear regulation function is taken as \( g(x) = x^2/(1 + x^2) \), so we can easily get \( k_1 = 0.65 \), the transmission probability is assumed to be \( \gamma = \begin{bmatrix} -0.4 & 0.4 \\ 0.6 & -0.6 \end{bmatrix} \), and time delays are chosen as

\[
\tau_1(t) = 0.4 + 0.2 \cos(t), \quad \tau_2(t) = 0.4 + 0.1 \sin(t), \quad \sigma_1(t) = 0.2 + 0.1 \sin(t), \\
\sigma_2(t) = 0.2 + 0.1 \cos(t).
\]
Then we have
\[ h_1 = 0.2, \quad h_2 = 0.1, \quad d_1 = 0.2, \quad d_2 = 0.6, \quad \mu_1 = 0.1, \quad \mu_2 = 0.1, \quad e_1 = 0.1, \quad e_2 = 0.3. \] (4.3)

By using Matlab Toolbox, solving (3.1) we can obtain the feasible solutions
\[
P_1 = \begin{bmatrix} 0.6720 & 0.0062 \\ 0.0062 & 0.7652 \end{bmatrix}, \quad P_2 = \begin{bmatrix} 0.7743 & 0.0563 \\ 0.0563 & 0.7245 \end{bmatrix}, \quad Q_1 = \begin{bmatrix} 1.0529 & 0.0021 \\ 0.0021 & 1.2663 \end{bmatrix},
\]
\[
Q_2 = \begin{bmatrix} 1.0926 & 0.0036 \\ 0.0036 & 1.3185 \end{bmatrix}, \quad N_1 = \begin{bmatrix} 0.3602 & 0.0278 \\ 0.0278 & 0.3244 \end{bmatrix}, \quad N_2 = \begin{bmatrix} 0.3521 & 0.0244 \\ 0.0244 & 0.3215 \end{bmatrix},
\]
\[
N_3 = \begin{bmatrix} 1.6260 & 0.0284 \\ 0.0284 & 1.8337 \end{bmatrix}, \quad M_1 = \begin{bmatrix} 0.0070 & 0.0016 \\ 0.0016 & 0.0052 \end{bmatrix}, \quad M_2 = \begin{bmatrix} 0.0338 & -0.0002 \\ -0.0002 & 0.0353 \end{bmatrix},
\]
\[
M_3 = \begin{bmatrix} 0.0891 & -0.0029 \\ -0.0029 & 0.0920 \end{bmatrix}, \quad R_1 = \begin{bmatrix} 0.1534 & 0.0253 \\ 0.0253 & 0.1688 \end{bmatrix}, \quad R_2 = \begin{bmatrix} 0.4415 & -0.0022 \\ -0.0022 & 0.3993 \end{bmatrix},
\]
\[
R_3 = \begin{bmatrix} 0.4192 & 0.0053 \\ 0.0053 & 0.3845 \end{bmatrix}, \quad R_4 = \begin{bmatrix} 1.2767 & -0.0102 \\ -0.0102 & 2.0128 \end{bmatrix}, \quad U = \begin{bmatrix} 0.0410 & 0.0032 \\ 0.0032 & 0.0373 \end{bmatrix},
\]
\[
V = \begin{bmatrix} 0.1146 & 0.0024 \\ 0.0024 & 0.1054 \end{bmatrix}, \quad \Lambda = \begin{bmatrix} 1.3501 & 0 \\ 0 & 2.0371 \end{bmatrix}.
\] (4.4)

Hence the Markovian jumping genetic regulatory networks with mode-dependent delays is asymptotically stable. Assume \( h_1 = 0.2, \mu_1 = 0.1, \mu_2 = 0.2, e_1 = 0.1, e_2 = 0.5, \) and \( d_1 = 0.2. \) Then we can calculate the maximal allowable bounds of \( d_2 \) with different values of \( h_2. \)

**Example 4.2.** Consider (3.16) where
\[
A_1 = \begin{bmatrix} 5 & 0 \\ 0 & 5 \end{bmatrix}, \quad B_1 = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}, \quad C_1 = \begin{bmatrix} 2.5 & 0 \\ 0 & 2.5 \end{bmatrix}, \quad D_1 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix},
\]
\[
A_2 = \begin{bmatrix} 5 & 0 \\ 0 & 5 \end{bmatrix}, \quad B_2 = \begin{bmatrix} 0 & 0 \\ 2 & 0 \end{bmatrix}, \quad C_2 = \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}, \quad D_2 = \begin{bmatrix} 0.8 & 0 \\ 0 & 0.8 \end{bmatrix}.
\] (4.5)

The uncertain parameters for every mode of the Markovian genetic regulatory networks are given by
\[
H_{a1} = \begin{bmatrix} -0.2 & 0 \\ 0 & -0.2 \end{bmatrix}, \quad H_{b1} = \begin{bmatrix} -0.1 & 0.2 \\ 0.08 & 0 \end{bmatrix}, \quad H_{c1} = \begin{bmatrix} -0.1 & 0 \\ 0 & -0.1 \end{bmatrix}, \quad H_{d1} = \begin{bmatrix} 0.15 & 0 \\ 0 & 0.15 \end{bmatrix},
\]
\[
E_1 = \begin{bmatrix} 0.3 & 0 \\ 0 & 0.3 \end{bmatrix}, \quad H_{a2} = \begin{bmatrix} -0.3 & 0 \\ 0 & -0.3 \end{bmatrix}, \quad H_{b2} = \begin{bmatrix} 0.1 & 0 \\ 0 & 0.1 \end{bmatrix}, \quad H_{c2} = \begin{bmatrix} -0.1 & 0 \\ 0 & -0.1 \end{bmatrix}, \quad H_{d2} = \begin{bmatrix} 0.1 & 0 \\ 0 & 0.1 \end{bmatrix}, \quad E_2 = \begin{bmatrix} 0.1 & 0 \\ 0 & 0.1 \end{bmatrix}.
\] (4.6)
By employing a new Lyapunov-Krasovskii function and a lemma to deal with the terms
In this paper, we have dealt with the robust stability analysis problem for the Markovian jump-

Applying Theorem 3.4 to system of LMIs to ensure the robust stability of the addressed Markovian jumping genetic networks

Choosing $\tau_{i} = t_{i} - \eta_{t_{i}}$, some less conservative sufficient conditions in the terms of LMIs to ensure the robust stability of the addressed Markovian jumping genetic networks

The nonlinear regulation function is taken as $g(x) = x^{2}/(1+x^{2})$, so we can easily get $k_{i} = 0.65$, the transmission probability is assumed to be $\gamma = [-0.4 \quad 0.4 \quad -0.4 \quad -0.4]$. Choosing $h_{1} = 0.1$, $h_{2} = 0.1$, $d_{1} = 0$, $d_{2} = 0.2$, $\mu_{1} = 0.1$, $\mu_{2} = 0.1$, $e_{1} = 0.2$, and $e_{2} = 0.4$. Applying Theorem 3.4 to system (3.16), we can get the following feasible solutions:

$$
P_{1} = \begin{bmatrix} 3.6297 & -0.0003 \\ -0.0003 & 2.7195 \end{bmatrix}, \quad P_{2} = \begin{bmatrix} 3.6878 & -0.0003 \\ -0.0003 & 2.5334 \end{bmatrix}, \quad Q_{1} = \begin{bmatrix} 6.3467 & -0.0029 \\ -0.0029 & 5.0050 \end{bmatrix},
$$

$$
Q_{2} = \begin{bmatrix} 5.6235 & -0.0024 \\ -0.0024 & 4.5655 \end{bmatrix}, \quad N_{1} = \begin{bmatrix} 4.6944 & 0 \\ 0 & 3.5184 \end{bmatrix}, \quad N_{2} = \begin{bmatrix} 4.4643 & 0 \\ 0 & 3.2752 \end{bmatrix},
$$

$$

$$

Assume $h_{1} = 0.1$, $\mu_{1} = 0.1$, $\mu_{2} = 0.1$, $e_{1} = 0.2$, $e_{2} = 0.4$, and $d_{1} = 0$. Then we can calculate the maximal allowable bounds of $d_{2}$ with different values of $h_{2}$.

It can be seen from Tables 1 and 2 that using the lemma will yield less conservative results.

5. Conclusions

In this paper, we have dealt with the robust stability analysis problem for the Markovian jumping genetic regulatory networks with parameter uncertainties and mode-dependent delays. By employing a new Lyapunov-Krasovskii function and a lemma to deal with the terms $-(\tau(t)/d_{2})\xi^{T}(t)\times e_{2}^{T}R_{1}e_{2}\xi(t), -[1-(\tau(t)/d_{2})]R_{1}e_{2}\xi(t), -(\sigma(t)/e_{2})\eta^{T}(t) e_{2}^{T}R_{3}e_{3}\eta(t)$, and $-[1-(\sigma(t)/e_{2})]e_{2}^{T}R_{3}e_{3}\eta(t)$, some less conservative sufficient conditions in the terms of LMIs to ensure the robust stability of the addressed Markovian jumping genetic networks
are derived. Finally, two examples are given to illustrate the usefulness of the derived LMIs-based stability conditions.
