

Mathematical Problems in Engineering

Special Issue on **Mathematical and Computational Topics in Design Studies**

CALL FOR PAPERS

For increasing the added value and competitiveness of product, recently, design studies and their applications have been paid closer attention than ever. Good design has always been considered as the perfect combination of creativity and experience of designer. In contrast to engineering, design problems had been thought as unsolvable by scientific methods. Now, due to the advances of design studies, many new design methods have been proposed. These methods reduce the time consumption of design by introducing some technical procedures and rules. Particularly, the popularization of computer and the release of many powerful CAD tools have greatly shortened the design cycle. With simulation software, designers reduce the time and cost of prototyping. The advancement of machine learning, data mining, and other techniques provides excellent tools for information collecting, data analyzing, behavior forecast, and decision-making. Therefore, the design complexity of consumer behavior, social and cultural preferences, environmental impacts, and economic factors can be taken into account properly.

Design studies include not only the study of design itself but also marketing, service, and strategy of design. In addition, qualitative and quantitative thinking of its influence and the study of design education are all involved. The researches of design have been improved enormously by introducing the quantitative methodologies of engineering (such as information engineering, electrical and electronic engineering, mechanical engineering, civil and environmental engineering, and Kansei engineering) and social science (such as psychology, sociology, and economics and management science). We invite investigators interested in modeling and computation of design to contribute their original research articles to this special issue.

Potential topics include, but are not limited to:

- ▶ Various computational topics of methodologies and procedures of design
- ▶ Mathematical techniques to reduce time and cost of design
- ▶ Mathematical tools or methods that assist the marketing or decision-making of design
- ▶ Computational issues to promote design education
- ▶ Computational topics about design services or cultural, environmental, social, and economic aspects of design
- ▶ Mathematical modeling and computation about design procedure, strategy, and management
- ▶ Other design-related mathematical topics

Lead Guest Editor

Teen-Hang Meen, National Formosa University, Yunlin County, Taiwan
