NOTES ON NEARCTIC NEUROPTERA

By F. M. Carpenter

Since the publication of my revision of the Nearctic Hemero-
biidæ and related Neuroptera,¹ several collections of these in-
ssects have been sent to me for identification. Notes on the
most interesting and unusual species are included here. I am
indebted to the entomologists mentioned below for the oppor-
tunity of examining this additional material.

FAMILY HEMEROBIIDÆ

Kimminsia involuta Carp.

In the Cornell University collection there are four speci-
mens (♂ ♀) of this species collected in North Carolina
(“N.C.”) by F. Sherman, Jr. Involuta has previously been
known only from western Canada, Idaho, Wyoming and Colo-
rado. In all probability these specimens were found in the
mountainous (western) part of N. Carolina, the insect fauna
of which has several other species and genera in common with
that of the north-western states.

Megalomus maestus Banks

Several specimens (♂ ♀) were collected in the Black Hills,
South Dakota (July 20, 1939) by D. J. and J. N. Knull (Ohio
State University collection). The most eastern record of maes-
tus has previously been at Laramie, Wyoming.

Sympherobius angustus (Banks)

One female was collected in the Chirichua Mts., Arizona
(July 15, 1939, D. J. and J. N. Knull); it is the first record
of angustus in that state.

Sympherobius arizonicus Banks

The ♀ type has previously been the only specimen of this
insect known to me. In the Ohio State University collection
there are three additional specimens from the Santa Rita Mts.,

Arizona (June 8 and 24, D. J. and J. N. Knull). Unfortunately, all of these are females, so that the male genital structure is still unknown.

*Sympherobius occidentalis* (Fitch)

One specimen of this rare insect has been collected in Indiana Dunes State Park, Indiana (July 27, 1940) by R. L. Wenzel (Field Mus. collection); this is the first record in that state.

**Family Sisyridae**

*Climacia areolaris* (Hagen)

A number of specimens were collected at the Deschutes River, near Richmond, Oregon (July 28 and 31, 1939, Shuh and Gray); and others have more recently been collected near Tower, Minnesota (University of Minnesota collection). These records greatly extend the range of *areolaris*, which has not previously been reported west of Michigan in the north or New Mexico in the south. It will probably turn up locally across northern United States.

**Family Berothidae**

*Lomamyia banksi* Carp.

A female collected at Buffalo, Texas (June 29, 1941, D. J. and J. N. Knull) is the first record in that state.

*Lomamyia longicollis* (Walker)

A male of this little-known insect is contained in the Uni-

![Fig. 1. Lomamyia longicollis (Walker) δ, tenth abdominal tergite and aedeagus. A, dorsal view; B, lateral view.](image-url)
University of Kansas collection; it was found at Iuka, Mississippi (July 14, 1930) by R. H. Beamer (University of Kansas collection), and is the only male known to me in addition to the type in the British Museum. Since the male genitalia of this species have not previously been described, I include here (Fig. 1) a drawing of the 10th abdominal tergite and ædeagus. The tergite is similar to that of tenuis Carp., but lacks the anterior and posterior dorsal lobes. The ædeagus also resembles that of tenuis.
