

## Lists of figures

**Figure S1: A-B:** Principal Component Analysis (PCA) was applied to 3 pairs of SCEC tissues (red) and matched adjacent normal tissues (blue) that were characterized by the gene expression of all probes on Affymetrix HG U133 Plus 2.0 Array. **C:** Box plot of SCEC group. **D:** Pearson's correlation matrix of SCEC group.

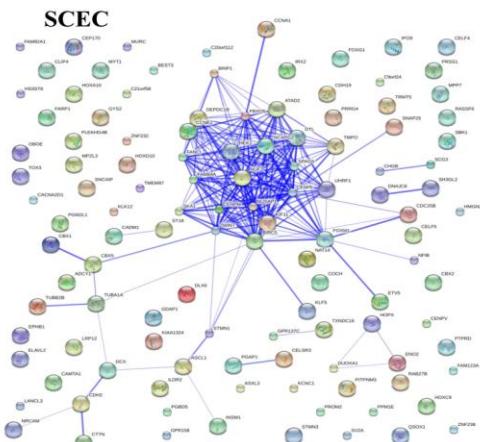

**Figure S2:** MvA plot of SCEC group.

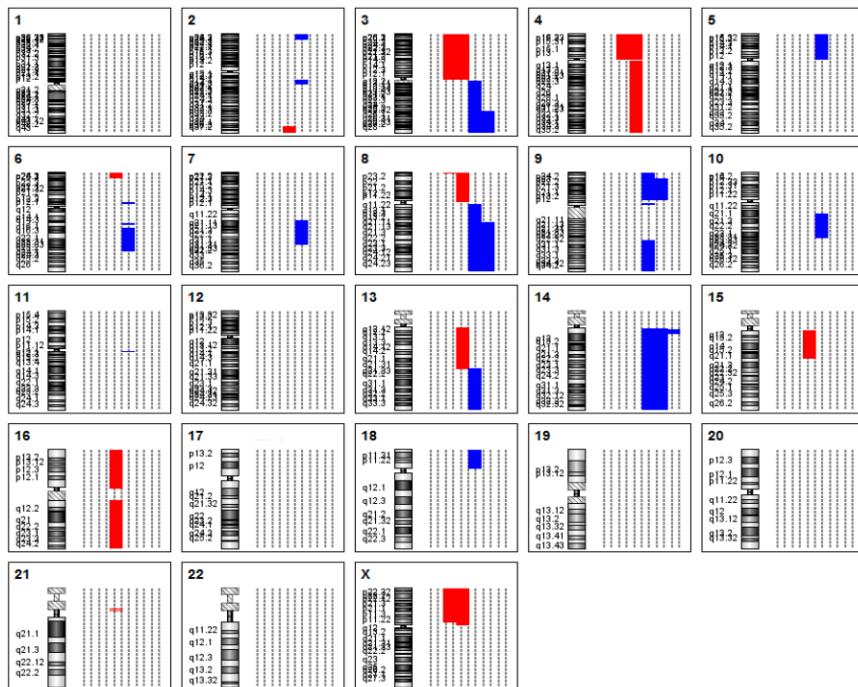

**Figure S3: Volcano plots of probe sets differing between SCEC and matched normal tissues.**

Fold change (X axis) is plotted against statistical significance (Y axis) for each probe sets. Genes altered with a fold change  $\geq 2$  and FDR  $< 0.01$  are depicted in red. Grey represents genes in the arrays that were not found to differ significantly between cancerous samples and matched normal samples.

**Figure S4:** Gene regulatory network plotted by the top 120 DEGs (ranked by FDR) of SCEC groups.

**Figure S5: DNA copy number change profiles in 3 pairs of SCEC samples.** The CNVs frequency of the whole genome was analyzed by aCGH. Gains were marked in red and losses in blue.

## Lists of tables

**Table S1. Primers used in qRT-PCR for microarray gene expression validation**

Gene	Forward Primer (5'-3')	Reverse Primer (5'-3')	Product
