**Supplementary Figure S1. Overview of swatCGH data processing framework.****Supplementary Figure S2. Focusing regions of interest using decreasing probe window sizes.**

The AT used (dashed line) defines the CRI shown by the red bars, with the MRI being denoted by the thickest part of the bar. Use of (A) 20, (B) 5, and (C) 3 probe window sizes focuses the copy number loss region of interest on chromosome 9 in the GBM dataset to 21.73 Mb – 22 Mb. Panel D illustrates the setting of an 80% adaptive threshold (x axis) for gating the amount of copy number loss (y axis) to 5% of chromosome 9.

**Supplementary Figure S3. Identification of regions of interest in GBM dataset by swatCGH.**

The panels show representative swatCGH data for chromosomes showing copy number loss (A-C) for the GBM dataset, using data segmented by DNAcopy. Panel A shows the chromosome overview plot, representing the median aCGH profiles (top), sample recurrence plot (middle), and high-level CNA plot (bottom). Dashed lines in the middle panel represent 0% AT. Panel B is regional probe classification views of a copy number loss CRI on chromosome 9 (21.7-22.7 Mb). In panel B samples are clustered by probe classifications (green = gain; red = loss; grey = normal; yellow = high-level gain; cyan = high-level loss).

The red boxes indicate the MRI identified for the region, linked by the arrow from the same region of the middle plot in panel A. Panel C illustrates a hyperlink from the MRI to the ENSEMBL genome browser, provided in swatCGH output.

**Supplementary Figure S4. Genome wide overview of CNAs detected in 38 GBMs by swatCGH**

The panels show swatCGH CNA data for chromosomes of the GBM dataset using data segmented by DNAcopy. Within each panel, the top view shows the median aCGH profiles, the middle view gives CNA recurrence plots where thin rectangles are CRIs and thick rectangles are MRIs (green; gain, red; loss). The high-level CNA plot is represented at the bottom (yellow; amplification, cyan; deletion). Dashed lines in the middle panel represent ATs separately computed to achieve per chromosomal gains and losses at 5%.

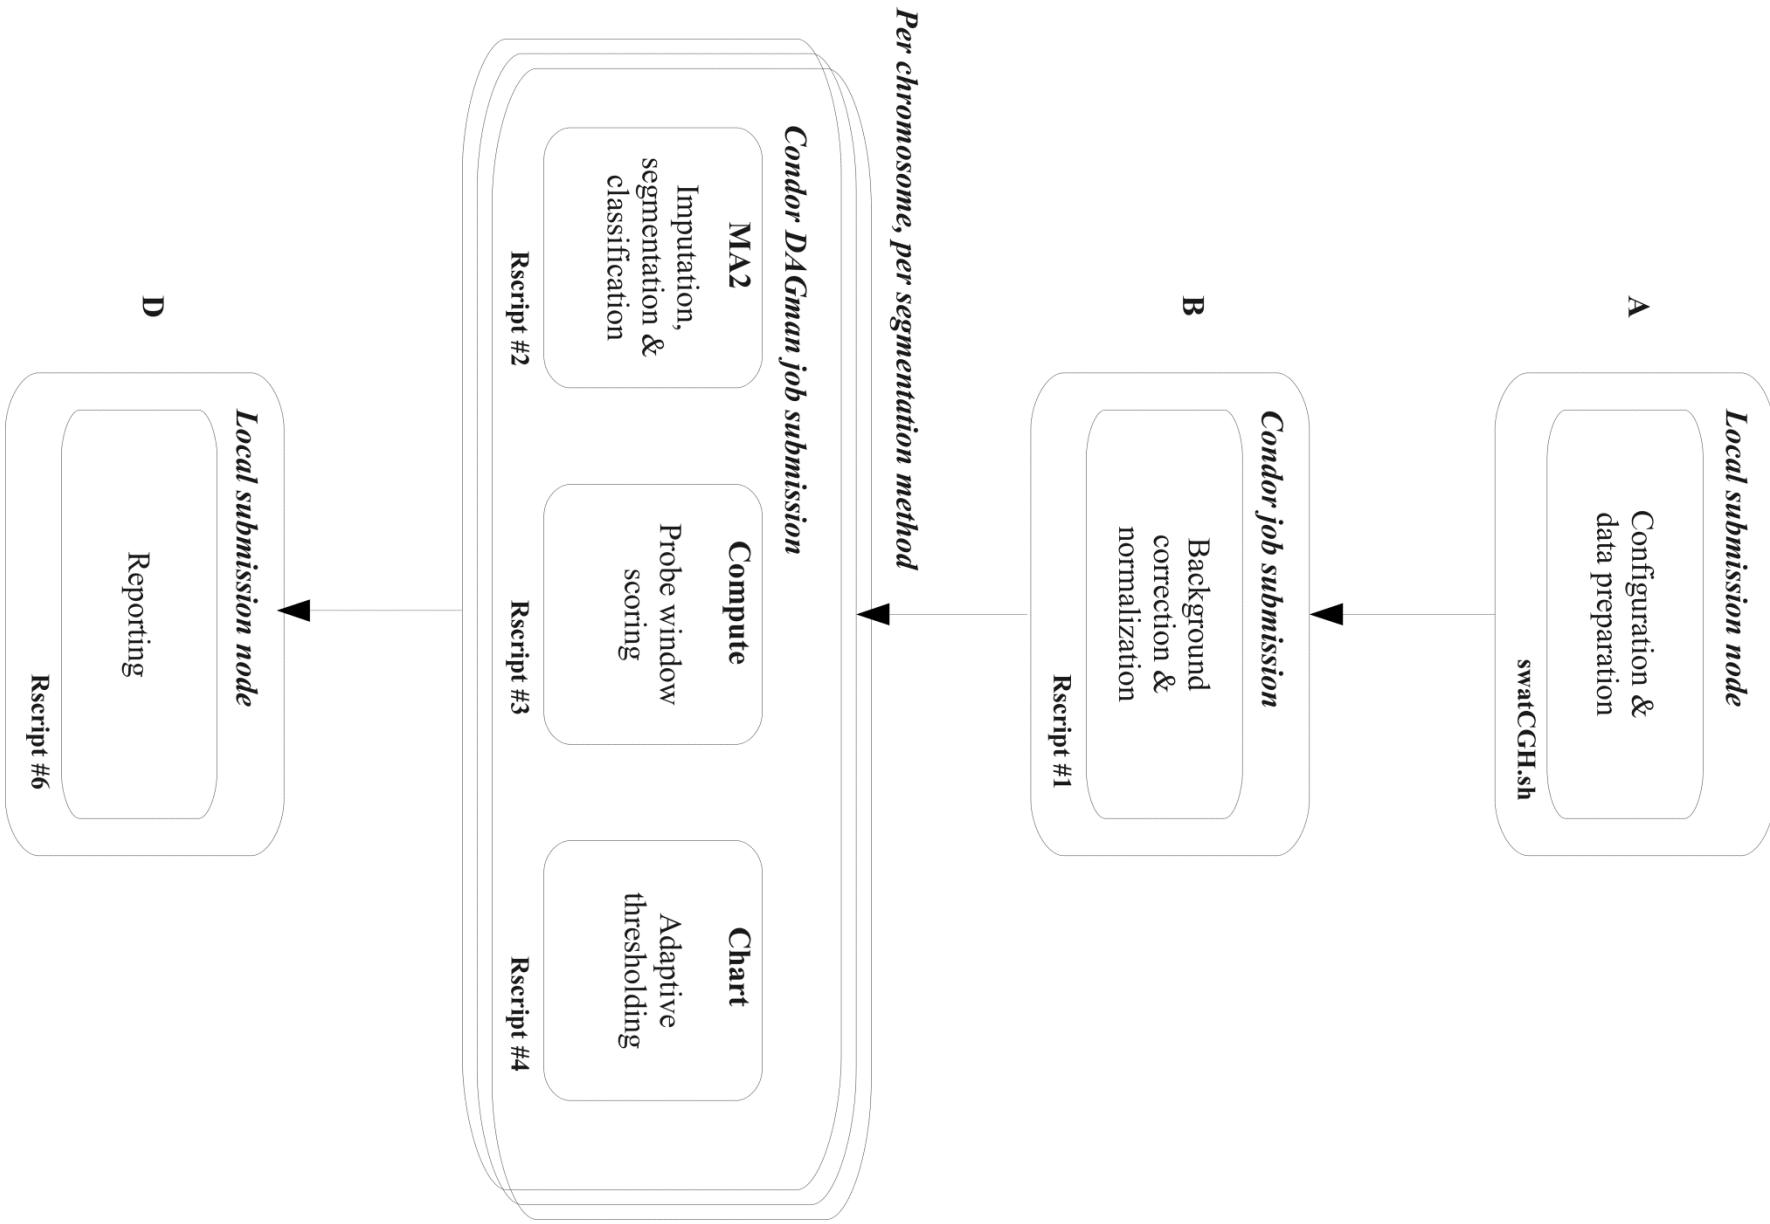

**Supplementary Figure S5. swatCGH copy number karyograms**

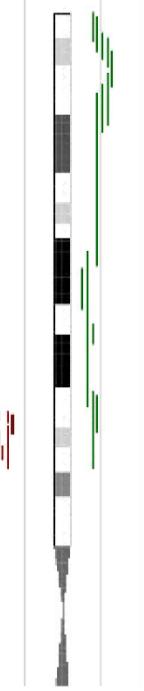

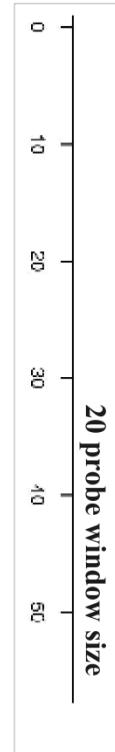

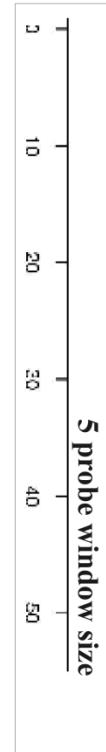

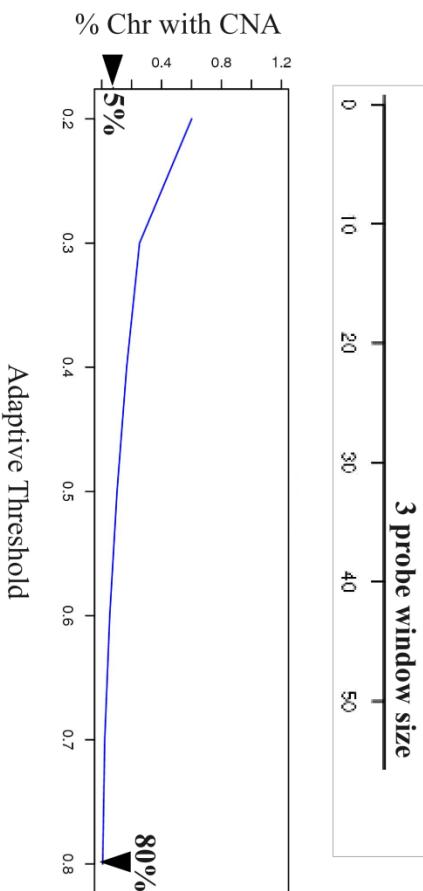

The results shown are for chromosomes 1, 3, 4, 5, 7, 9, 10, 11, 13, 14, & 20, using data segmented by DNAcopy. Red bars to left of each ideogram indicate regions of copy number loss, while cyan bars signify high-level loss. Green bars to right of each ideogram represent regions of copy number gain, while yellow bars represent high-level gain. The purple bars on

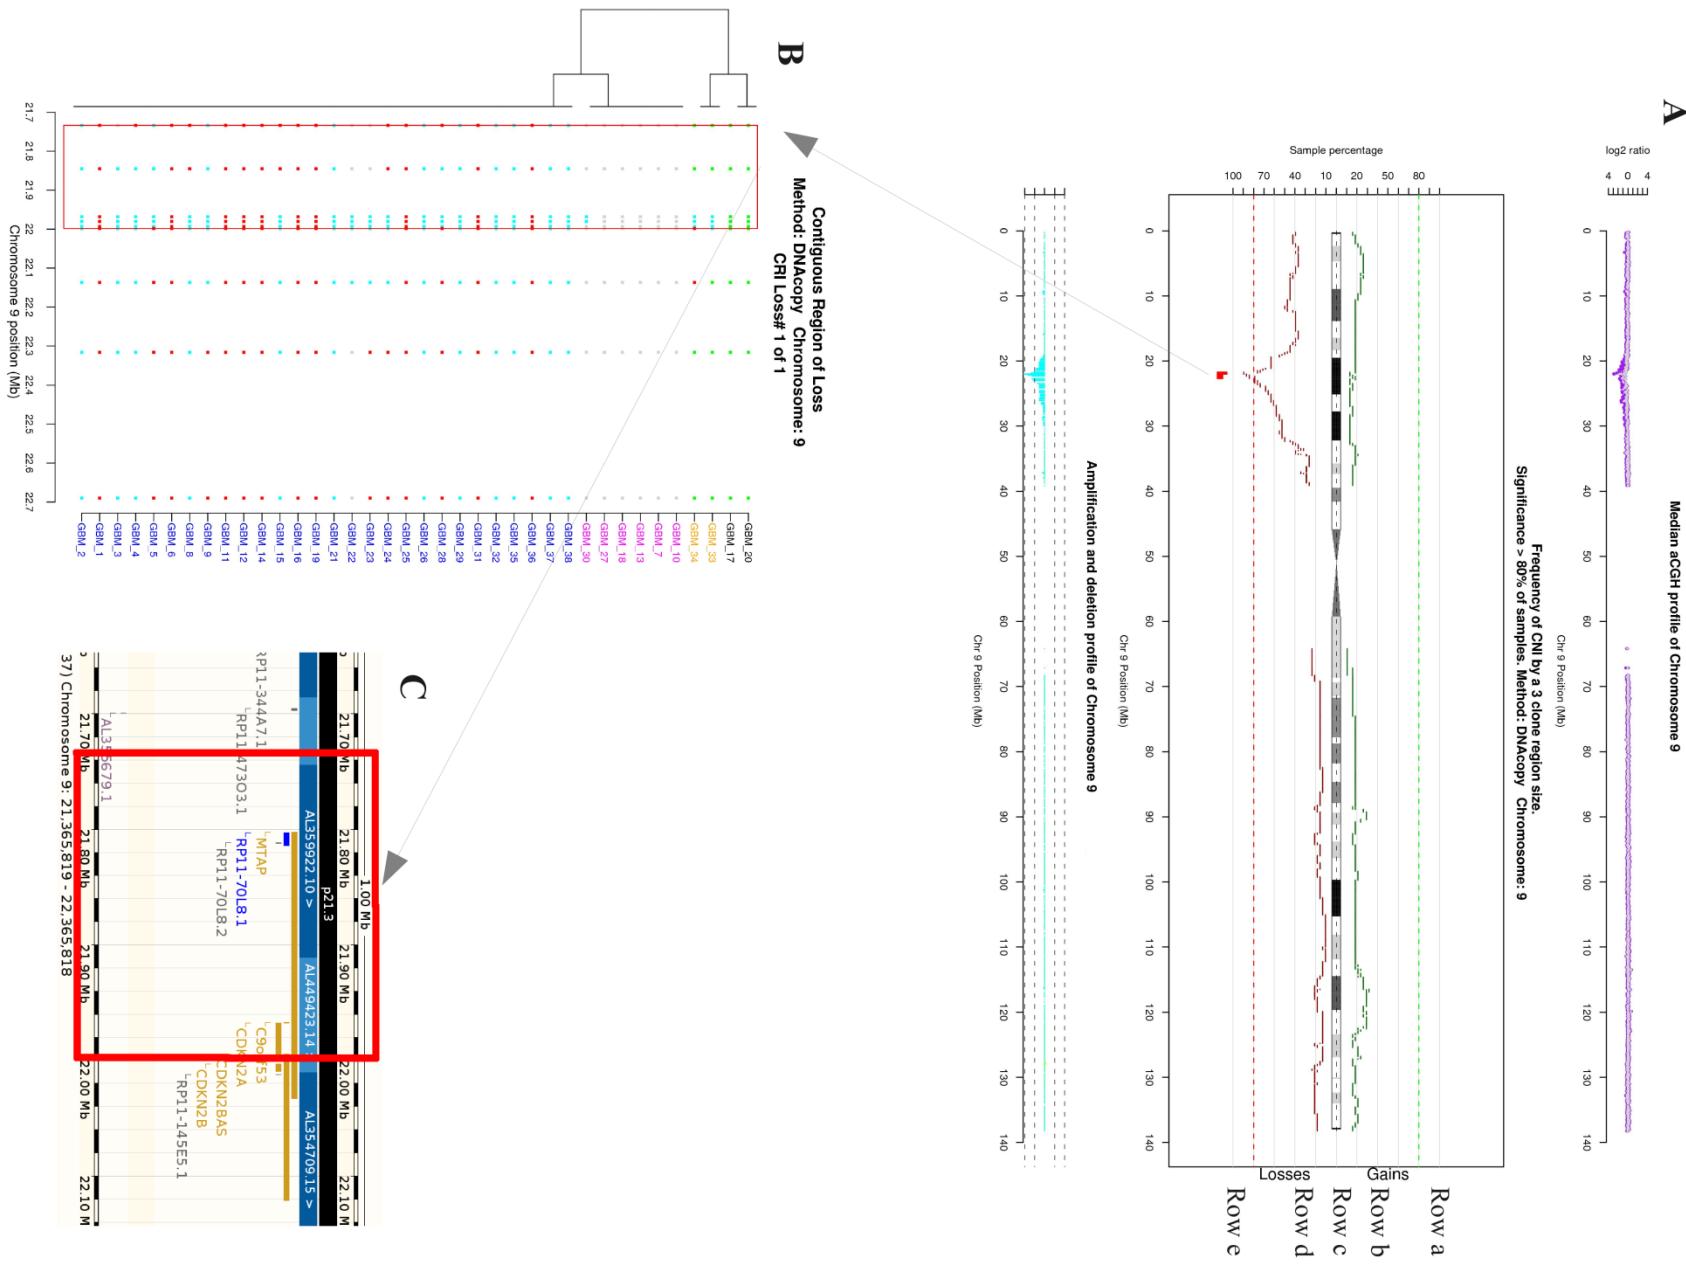

either side of each ideogram denote the CRIs identified by swatCGH analysis. Arrowheads locate MRIs identified as significant using amplitude-based prioritization ( $p < 0.1$ ).

**Supplementary Figure S6. Selection of MRIs identified in data preprocessed by at least two segmentation methods.**

The panels show representative data for chromosomes 1, 3, 4, 5, 7, 9, 10, 11, 13, 14, and 20 with (A) showing amplitude-dependent prioritized data (as in Supplementary Table S1) and (B) showing data from gene-centred prioritization of the amplitude filtered data (as in Supplementary Table S2). In each graph the x axis represents genome position and the Y axis is the MRI index number (ordered by genome position). The horizontal bars represent MRIs identified following each segmentation method, colour coded (see key for colour code). Regions of overlap between different coloured points represent MRIs identified by multiple segmentation methods. These are highlighted in Panel A, where purple stars show regions identified from the amplitude prioritization data only, while cyan stars show regions identified from data prioritized using both methods.

**Supplementary Table S1. Regions of interest detected by amplitude dependent prioritization following preprocessing using four methods of DNA segmentation.**

Supplementary Table S1A shows data for copy number gain and Supplementary Table S1B shows data for copy number loss. Each section has four panels, representing data obtained following each of the four segmentation methods. Each panel is in halves. The left hand sections gives overall chromosomal statistics, including the CRIs identified, and the AT values used to detect them. The right hand panel reports the MRIs identified as significant following amplitude based prioritization, with respective gene information where appropriate. A maximum of 10 significant MRIs is given for any one chromosome. Significant regions are ranked by p-value following amplitude-based prioritization ( $p < 0.1$ ). Column labels: Chr = chromosome; AT 5% = adaptive threshold to achieve 5% copy number imbalance; Number CRI = number of contiguous regions of interest; Mb DNA = combined length of CRIs imbalanced per chromosome; Prop. Chr. = proportion of chromosome forming CRIs; Max. PWS = maximum probe window score (i.e. frequency of CNA recurrence across the sample set); Recurrence = maximum recurrence frequency of an individual MRI across a sample set; Mid Position = location of MRI mid point; Mb DNA = width of MRI; GDW = gene density weight; Score = Modified GTS score; p-value = significance in amplitude based prioritization analysis; Gene = known genes in MRI. A maximum of 10 significant MRIs are given for any one chromosome.

**Supplementary Table S2. Effect on rank ordering of significant MRIs identified by amplitude-dependent prioritization ( $p < 0.1$ ), following application of gene-centred prioritization using modified GTS.**

Findings are presented separately for data preprocessed by each segmentation method.

**Supplementary Table S3. Effect on rank ordering of all MRIs following application of gene centred prioritization using modified GTS.**

The table shows the top 10 MRIs identified from data processed using each segmentation algorithm.

**Supplementary Table S4. The final set of 35 MRIs identified from the consolidated data.**

The MRIs were identified following preprocessing with at least two DNA segmentation algorithms, for both amplitude-based and gene-centred prioritization methods. Column labels: Rated by = type of prioritization method, where (A) is amplitude-dependent and (B) is gene-centred modified GTS; Method = segmentation method, where (B) is BioHMM, (D) is DNAcopy, (H) is HomHMM, and (G) GLAD; CNA = type of copy number aberration, either gain or loss; Chr = chromosome; Start = location of region start (Mb); End = location of region end (Mb); Gene = known genes in region; \* = Gene NA is approximately 80 kb from EGFR.

**Supplementary Table S5. Comparison of regions of interest identified by GISTIC following four methods of DNA segmentation.**

For each segmentation method, data is provided for regions of copy number gain, regions of copy number loss, and for the total CNAs.

**Supplementary Table S1A (Copy number gain data)**
