

Table S1. End-joining in *Arabidopsis* leaf protoplast as determined by Q-PCR.

Protoplast were isolated from wild-type (WT), Atku70 or Atku80 mutants and transformed with linear plasmid (X) or circular plasmid (O) in triplicate.

End-joining was determined as the ratio of q8-q9 products devided by q10-q11 products, corrected for dying protoplast (X/O), during 24h of incubation (X24h-X0h).

The ratio of end-joining in the mutants compared to the wild-type was calculated (X24h-X0h)/AVG(X24h-X0h)WT and the average and standard deviation was calculated.

The value of the wild-type was set on 1.
