We construct a new Halpern type iterative scheme by hybrid methods and prove strong convergence theorem for approximation of a common fixed point of two countable families of weak relatively nonexpansive mappings in a uniformly convex and uniformly smooth real Banach space using the properties of generalized f -projection operator. Using this result, we discuss strong convergence theorem concerning general H -monotone mappings. Our results extend many known recent results in the literature.

1. Introduction

Let E be a real Banach space with dual E^* and let C be nonempty, closed and convex subset of E . A mapping $T : C \rightarrow C$ is called *nonexpansive* if

$$\|Tx - Ty\| \leq \|x - y\|, \quad \forall x, y \in C. \quad (1.1)$$

A point $x \in C$ is called a *fixed point* of T if $Tx = x$. The set of fixed points of T is denoted by $F(T) := \{x \in C : Tx = x\}$.

We denote by J the normalized duality mapping from E to 2^{E^*} defined by

$$J(x) = \left\{ f \in E^* : \langle x, f \rangle = \|x\|^2 = \|f\|^2 \right\}. \quad (1.2)$$

The following properties of J are well known. (The reader can consult [1–3] for more details).

- (1) If E is uniformly smooth, then J is norm-to-norm uniformly continuous on each bounded subset of E .

- (2) $J(x) \neq \emptyset$, $x \in E$.
- (3) If E is reflexive, then J is a mapping from E onto E^* .
- (4) If E is smooth, then J is single valued.

Throughout this paper, we denote by ϕ , the functional on $E \times E$ defined by

$$\phi(x, y) = \|x\|^2 - 2\langle x, J(y) \rangle + \|y\|^2, \quad \forall x, y \in E. \quad (1.3)$$

From [4], in uniformly convex and uniformly smooth Banach spaces, we have

$$\left(\|x\| - \|y\|\right)^2 \leq \phi(x, y) \leq (\|x\| + \|y\|)^2, \quad \forall x, y \in E. \quad (1.4)$$

Definition 1.1. Let C be a nonempty subset of E and let $\{T_n\}_{n=0}^\infty$ be a countable family of mappings from C into E . A point $p \in C$ is said to be a *asymptotic fixed point* of $\{T_n\}_{n=0}^\infty$ if C contains a sequence $\{x_n\}_{n=0}^\infty$ which converges weakly to p and $\lim_{n \rightarrow \infty} \|x_n - T_n x_n\| = 0$. The set of asymptotic fixed points of T is denoted by $\widehat{F}(\{T_n\}_{n=0}^\infty)$. We say that $\{T_n\}_{n=0}^\infty$ is *countable family of relatively nonexpansive mappings* (see, e.g., [5]) if the following conditions are satisfied:

- (R1) $F(\{T_n\}_{n=0}^\infty) \neq \emptyset$;
- (R2) $\phi(p, T_n x) \leq \phi(p, x)$, for all $x \in C$, $p \in F(T_n)$, $n \geq 0$;
- (R3) $\bigcap_{n=0}^\infty F(T_n) = \widehat{F}(\{T_n\}_{n=0}^\infty)$.

Definition 1.2. A point $p \in C$ is said to be a *strong asymptotic fixed point* of $\{T_n\}_{n=0}^\infty$ if C contains a sequence $\{x_n\}_{n=0}^\infty$ which converges strongly to p and $\lim_{n \rightarrow \infty} \|x_n - T_n x_n\| = 0$. The set of strong asymptotic fixed points of T is denoted by $\widetilde{F}(\{T_n\}_{n=0}^\infty)$. We say that a mapping $\{T_n\}_{n=0}^\infty$ is *countable family of weak relatively nonexpansive mappings* (see, e.g., [5]) if the following conditions are satisfied:

- (R1) $F(\{T_n\}_{n=0}^\infty) \neq \emptyset$;
- (R2) $\phi(p, T_n x) \leq \phi(p, x)$, for all $x \in C$, $p \in F(T_n)$, $n \geq 0$;
- (R3) $\bigcap_{n=0}^\infty F(T_n) = \widetilde{F}(\{T_n\}_{n=0}^\infty)$.

Definition 1.3. Let C be a nonempty subset of E and let T be a mapping from C into E . A point $p \in C$ is said to be an *asymptotic fixed point* of T if C contains a sequence $\{x_n\}_{n=0}^\infty$ which converges weakly to p and $\lim_{n \rightarrow \infty} \|x_n - T x_n\| = 0$. The set of asymptotic fixed points of T is denoted by $\widehat{F}(T)$. We say that a mapping T is *relatively nonexpansive* (see, e.g., [6–11]) if the following conditions are satisfied:

- (R1) $F(T) \neq \emptyset$;
- (R2) $\phi(p, T x) \leq \phi(p, x)$, for all $x \in C$, $p \in F(T)$;
- (R3) $F(T) = \widehat{F}(T)$.

Definition 1.4. A point $p \in C$ is said to be an *strong asymptotic fixed point* of T if C contains a sequence $\{x_n\}_{n=0}^\infty$ which converges strongly to p and $\lim_{n \rightarrow \infty} \|x_n - T x_n\| = 0$. The set of strong

asymptotic fixed points of T is denoted by $\tilde{F}(T)$. We say that a mapping T is *weak relatively nonexpansive* (see, e.g., [12, 13]) if the following conditions are satisfied:

- (R1) $F(T) \neq \emptyset$;
- (R2) $\phi(p, Tx) \leq \phi(p, x)$, for all $x \in C$, $p \in F(T)$;
- (R3) $F(T) = \tilde{F}(T)$.

Definition 1.3 (Definition 1.4, resp.) is a special form of Definition 1.1 (Definition 1.2, resp.) as $T_n \equiv T$, for all $n \geq 0$. Furthermore, Su et al. [5] gave an example which is a countable family of weak relatively nonexpansive mappings but not a countable family of relatively nonexpansive mappings. It is obvious that relatively nonexpansive mapping is weak relatively nonexpansive mapping. In fact, for any mapping $T : C \rightarrow C$, we have $F(T) \subset \tilde{F}(T) \subset \hat{F}(T)$. Therefore, if T is relatively nonexpansive mapping, then $F(T) = \tilde{F}(T) = \hat{F}(T)$. Kang et al. [12] gave an example of a weak relatively nonexpansive mapping which is not relatively nonexpansive.

In [9], Matsushita and Takahashi introduced a hybrid iterative scheme for approximation of fixed points of relatively nonexpansive mapping in a uniformly convex real Banach space which is also uniformly smooth: $x_0 \in C$,

$$\begin{aligned} y_n &= J^{-1}(\alpha_n Jx_n + (1 - \alpha_n)JT x_n), \\ H_n &= \{w \in C : \phi(w, y_n) \leq \phi(w, x_n)\}, \\ W_n &= \{w \in C : \langle x_n - w, Jx_0 - Jx_n \rangle \geq 0\}, \\ x_{n+1} &= \Pi_{H_n \cap W_n} x_0, \quad n \geq 0. \end{aligned} \tag{1.5}$$

They proved that $\{x_n\}_{n=0}^\infty$ converges strongly to $\Pi_{F(T)}x_0$, where $F(T) \neq \emptyset$.

In [14], Plubtieng and Ungchittarakool introduced the following hybrid projection algorithm for a pair of relatively nonexpansive mappings: $x_0 \in C$,

$$\begin{aligned} z_n &= J^{-1}(\beta_n^{(1)}Jx_n + \beta_n^{(2)}JT x_n + \beta_n^{(3)}JSx_n), \\ y_n &= J^{-1}(\alpha_n Jx_0 + (1 - \alpha_n)Jz_n), \\ C_n &= \left\{z \in C : \phi(z, y_n) \leq \phi(z, x_n) + \alpha_n \left(\|x_0\|^2 + 2\langle w, Jx_n - Jx_0 \rangle \right)\right\}, \\ Q_n &= \{z \in C : \langle x_n - z, Jx_n - Jx_0 \rangle \leq 0\}, \\ x_{n+1} &= P_{C_n \cap Q_n} x_0, \end{aligned} \tag{1.6}$$

where $\{\alpha_n\}, \{\beta_n^{(1)}\}, \{\beta_n^{(2)}\}$ and $\{\beta_n^{(3)}\}$ are sequences in $(0, 1)$ satisfying $\beta_n^{(1)} + \beta_n^{(2)} + \beta_n^{(3)} = 1$ and T and S are relatively nonexpansive mappings and J is the single-valued duality mapping on E . They proved under the appropriate conditions on the parameters that the sequence $\{x_n\}$ generated by (1.6) converges strongly to a common fixed point of T and S .

Recently, Li et al. [15] introduced the following hybrid iterative scheme for approximation of fixed points of a relatively nonexpansive mapping using the properties

of generalized f -projection operator in a uniformly smooth real Banach space which is also uniformly convex: $x_0 \in C$,

$$\begin{aligned} y_n &= J^{-1}(\alpha_n Jx_n + (1 - \alpha_n)JT x_n), \\ C_{n+1} &= \{w \in C_n : G(w, Jy_n) \leq G(w, Jx_n)\}, \\ x_{n+1} &= \Pi_{C_{n+1}}^f x_0, \quad n \geq 1. \end{aligned} \tag{1.7}$$

They proved a strong convergence theorem for finding an element in the fixed points set of T . We remark here that the results of Li et al. [15] extended and improved on the results of Matsushita and Takahashi, [9].

Quite recently, motivated by the results of Matsushita and Takahashi [9] and Plubtieng and Ungchittrakool [14], Su et al. [5] proved the following strong convergence theorem by Halpern type hybrid iterative scheme for approximation of common fixed point of two countable families of weak relatively nonexpansive mappings in uniformly convex and uniformly smooth Banach space.

Theorem 1.5. *Let E be a uniformly convex real Banach space which is also uniformly smooth. Let C be a nonempty, closed and convex subset of E . Suppose $\{T_n\}_{n=1}^\infty$ and $\{S_n\}_{n=1}^\infty$ are two countable families of weak relatively nonexpansive mappings of C into itself such that $F := ((\bigcap_{n=1}^\infty F(S_n))_{n=1}^\infty F(T_n)) \cap (\bigcap_{n=1}^\infty F(S_n)) \neq \emptyset$. Suppose $\{x_n\}_{n=0}^\infty$ is iteratively generated by $x_0 \in C$,*

$$\begin{aligned} z_n &= J^{-1}(\beta_n^{(1)} Jx_0 + \beta_n^{(2)} JT_n x_n + \beta_n^{(3)} JS_n x_n), \\ y_n &= J^{-1}(\alpha_n Jz_n + (1 - \alpha_n)Jx_n), \\ C_n &= \{w \in C_{n-1} \cap Q_{n-1} : \phi(w, y_n) \leq (1 - \alpha_n \beta_n^{(1)})\phi(w, x_n) + \alpha_n \beta_n^{(1)}\phi(w, x_0)\}, \\ C_0 &= \{w \in C : \phi(w, y_0) \leq \phi(w, x_0)\}, \\ Q_n &= \{w \in C_{n-1} \cap Q_{n-1} : \langle x_n - w, Jx_0 - Jx_n \rangle \geq 0\}, \\ Q_0 &= C, \\ x_{n+1} &= \Pi_{C_n \cap Q_n} x_0, \quad n \geq 1, \end{aligned} \tag{1.8}$$

with the conditions

- (i) $\lim_{n \rightarrow \infty} \beta_n^{(1)} = 0$;
- (ii) $\limsup_{n \rightarrow \infty} \beta_n^{(2)} \beta_n^{(3)} > 0$.

Then, $\{x_n\}_{n=0}^\infty$ converges strongly to $\Pi_F x_0$.

Motivated by the above mentioned results and the ongoing research, it is our purpose in this paper to prove a strong convergence theorem by Halpern type iterative scheme for two countable families of weak relatively nonexpansive mappings in a uniformly convex and uniformly smooth real Banach space using the properties of generalized f -projection operator. Our results extend the results of Su et al. [5] and many other recent known results in the literature.

2. Preliminaries

Let E be a real Banach space. The modulus of smoothness of E is the function $\rho_E : [0, \infty) \rightarrow [0, \infty)$ defined by

$$\rho_E(t) := \sup \left\{ \frac{1}{2} (\|x + y\| + \|x - y\|) - 1 : \|x\| \leq 1, \|y\| \leq t \right\}. \quad (2.1)$$

E is uniformly smooth if and only if

$$\lim_{t \rightarrow 0} \frac{\rho_E(t)}{t} = 0. \quad (2.2)$$

Let $\dim E \geq 2$. The *modulus of convexity* of E is the function $\delta_E : (0, 2] \rightarrow [0, 1]$ defined by

$$\delta_E(\epsilon) := \inf \left\{ 1 - \left\| \frac{x + y}{2} \right\| : \|x\| = \|y\| = 1; \epsilon = \|x - y\| \right\}. \quad (2.3)$$

E is *uniformly convex* if for any $\epsilon \in (0, 2]$, there exists a $\delta = \delta(\epsilon) > 0$ such that if $x, y \in E$ with $\|x\| \leq 1$, $\|y\| \leq 1$ and $\|x - y\| \geq \epsilon$, then $\|(1/2)(x + y)\| \leq 1 - \delta$. Equivalently, E is uniformly convex if and only if $\delta_E(\epsilon) > 0$ for all $\epsilon \in (0, 2]$. A normed space E is called *strictly convex* if for all $x, y \in E$, $x \neq y$, $\|x\| = \|y\| = 1$, we have $\|\lambda x + (1 - \lambda)y\| < 1$, for all $\lambda \in (0, 1)$.

Let E be a smooth, strictly convex, and reflexive real Banach space and let C be a nonempty, closed, and convex subset of E . Following Alber [16], the generalized projection Π_C from E onto C is defined by

$$\Pi_C(x) := \arg \min_{y \in C} \phi(y, x), \quad \forall x \in E. \quad (2.4)$$

The existence and uniqueness of Π_C follows from the property of the functional $\phi(x, y)$ and strict monotonicity of the mapping J (see, e.g., [3, 4, 16–18]). If E is a Hilbert space, then Π_C is the metric projection of H onto C .

Next, we recall the concept of generalized f -projector operator, together with its properties. Let $G : C \times E^* \rightarrow \mathbb{R} \cup \{+\infty\}$ be a functional defined as follows:

$$G(\xi, \varphi) = \|\xi\|^2 - 2\langle \xi, \varphi \rangle + \|\varphi\|^2 + 2\rho f(\xi), \quad (2.5)$$

where $\xi \in C$, $\varphi \in E^*$, ρ is a positive number and $f : C \rightarrow \mathbb{R} \cup \{+\infty\}$ is proper, convex, and lower semicontinuous. From the definitions of G and f , it is easy to see the following properties:

- (i) $G(\xi, \varphi)$ is convex and continuous with respect to φ when ξ is fixed;
- (ii) $G(\xi, \varphi)$ is convex and lower semicontinuous with respect to ξ when φ is fixed.

Definition 2.1 (Wu and Huang [19]). Let E be a real Banach space with its dual E^* . Let C be a nonempty, closed, and convex subset of E . We say that $\Pi_C^f : E^* \rightarrow 2^C$ is a generalized f -projection operator if

$$\Pi_C^f \varphi = \left\{ u \in C : G(u, \varphi) = \inf_{\xi \in C} G(\xi, \varphi) \right\}, \quad \forall \varphi \in E^*. \quad (2.6)$$

For the generalized f -projection operator, Wu and Huang [19] proved the following theorem basic properties.

Lemma 2.2 (Wu and Huang [19]). *Let E be a real reflexive Banach space with its dual E^* . Let C be a nonempty, closed, and convex subset of E . Then the following statements hold:*

- (i) Π_C^f is a nonempty closed convex subset of C for all $\varphi \in E^*$;
- (ii) if E is smooth, then for all $\varphi \in E^*$, $x \in \Pi_C^f$ if and only if

$$\langle x - y, \varphi - Jx \rangle + \rho f(y) - \rho f(x) \geq 0, \quad \forall y \in C; \quad (2.7)$$

- (iii) if E is strictly convex and $f : C \rightarrow \mathbb{R} \cup \{+\infty\}$ is positive homogeneous (i.e., $f(tx) = tf(x)$ for all $t > 0$ such that $tx \in C$ where $x \in C$), then Π_C^f is a single valued mapping.

Fan et al. [20] showed that the condition f is positive homogeneous which appeared in Lemma 2.2 can be removed.

Lemma 2.3 (Fan et al. [20]). *Let E be a real reflexive Banach space with its dual E^* and C a nonempty, closed and convex subset of E . Then if E is strictly convex, then Π_C^f is a single valued mapping.*

Recall that J is a single valued mapping when E is a smooth Banach space. There exists a unique element $\varphi \in E^*$ such that $\varphi = Jx$ for each $x \in E$. This substitution in (4.3) gives

$$G(\xi, Jx) = \|\xi\|^2 - 2\langle \xi, Jx \rangle + \|x\|^2 + 2\rho f(\xi). \quad (2.8)$$

Now, we consider the second generalized f -projection operator in a Banach space.

Definition 2.4. Let E be a real Banach space and C a nonempty, closed and convex subset of E . We say that $\Pi_C^f : E \rightarrow 2^C$ is a generalized f -projection operator if

$$\Pi_C^f x = \left\{ u \in C : G(u, Jx) = \inf_{\xi \in C} G(\xi, Jx) \right\}, \quad \forall x \in E. \quad (2.9)$$

Obviously, the definition of $\{T_n\}_{n=0}^\infty$ is a countably family of weak relatively nonexpansive mappings is equivalent to

- (R'1) $F(\{T_n\}_{n=0}^\infty) \neq \emptyset$;
- (R'2) $G(p, JT_n x) \leq G(p, Jx)$, for all $x \in C$, $p \in F(T_n)$, $n \geq 0$.
- (R'3) $\bigcap_{n=0}^\infty F(T_n) = \tilde{F}(\{T_n\}_{n=0}^\infty)$.

Lemma 2.5 (Li et al. [15]). *Let E be a Banach space and $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ be a lower semicontinuous convex functional. Then there exists $x^* \in E^*$ and $\alpha \in \mathbb{R}$ such that*

$$f(x) \geq \langle x, x^* \rangle + \alpha, \quad \forall x \in E. \quad (2.10)$$

We know that the following lemmas hold for operator Π_C^f .

Lemma 2.6 (Li et al. [15]). *Let C be a nonempty, closed, and convex subset of a smooth and reflexive Banach space E . Then the following statements hold:*

- (i) $\Pi_C x^f$ is a nonempty closed, and convex subset of C for all $x \in E$;
- (ii) for all $x \in E$, $\hat{x} \in \Pi_C x^f$ if and only if

$$\langle \hat{x} - y, Jx - J\hat{x} \rangle + \rho f(y) - \rho f(x) \geq 0, \quad \forall y \in C; \quad (2.11)$$

- (iii) if E is strictly convex, then $\Pi_C x^f$ is a single valued mapping.

Lemma 2.7 (Li et al. [15]). *Let C be a nonempty, closed, and convex subset of a smooth and reflexive Banach space E . Let $x \in E$ and $\hat{x} \in \Pi_C^f x$. Then*

$$\phi(y, \hat{x}) + G(\hat{x}, Jx) \leq G(y, Jx), \quad \forall y \in C. \quad (2.12)$$

Lemma 2.8 (Su et al. [5]). *Let C be a nonempty, closed, and convex subset of a smooth, strictly convex Banach space E . Let T be a weak relatively nonexpansive mapping of C into itself. Then $F(T)$ is closed and convex.*

Also, this following lemma will be used in the sequel.

Lemma 2.9 (Kamimura and Takahashi [4]). *Let C be a nonempty, closed and convex subset of a smooth, uniformly convex Banach space E . Let $\{x_n\}_{n=1}^\infty$ and $\{y_n\}_{n=1}^\infty$ be sequences in E such that either $\{x_n\}_{n=1}^\infty$ or $\{y_n\}_{n=1}^\infty$ is bounded. If $\lim_{n \rightarrow \infty} \phi(x_n, y_n) = 0$, then $\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0$.*

Lemma 2.10 (Cho et al. [21]). *Let E be a uniformly convex real Banach space. For arbitrary $r > 0$, let $B_r(0) := \{x \in E : \|x\| \leq r\}$ and $\lambda, \mu, \gamma \in [0, 1]$ such that $\lambda + \mu + \gamma = 1$. Then, there exists a continuous strictly increasing convex function*

$$g : [0, 2r] \rightarrow \mathbb{R}, \quad g(0) = 0 \quad (2.13)$$

such that for every $x, y, z \in B_r(0)$, the following inequality holds:

$$\|\lambda x + \mu y + \gamma z\|^2 \leq \lambda \|x\|^2 + \mu \|y\|^2 - \lambda \mu g(\|x - y\|). \quad (2.14)$$

For the rest of this paper, the sequence $\{x_n\}_{n=0}^\infty$ converges strongly to p will be denoted by $x_n \rightarrow p$ as $n \rightarrow \infty$ and we will assume that $\beta_n^{(1)}, \beta_n^{(2)}, \beta_n^{(3)} \in [0, 1]$ such that $\beta_n^{(1)} + \beta_n^{(2)} + \beta_n^{(3)} = 1$, for all $n \geq 0$.

3. Main Results

Theorem 3.1. *Let E be a uniformly convex real Banach space which is also uniformly smooth. Let C be a nonempty, closed, and convex subset of E . Suppose $\{T_n\}_{n=0}^\infty$ and $\{S_n\}_{n=0}^\infty$ are two countable families of weak relatively nonexpansive mappings of C into itself such that $F := (\bigcap_{n=0}^\infty F(T_n)) \cap (\bigcap_{n=0}^\infty F(S_n)) \neq \emptyset$. Let $f : E \rightarrow \mathbb{R}$ be a convex and lower semicontinuous mapping with $C \subset \text{int}(D(f))$ and suppose $\{x_n\}_{n=0}^\infty$ is iteratively generated by $x_0 \in C$, $C_0 = C$,*

$$\begin{aligned} z_n &= J^{-1}(\beta_n^{(1)} Jx_0 + \beta_n^{(2)} JT_n x_n + \beta_n^{(3)} JS_n x_n), \\ y_n &= J^{-1}(\alpha_n Jz_n + (1 - \alpha_n) Jx_n), \\ C_{n+1} &= \left\{ w \in C_n : G(w, Jy_n) \leq (1 - \alpha_n \beta_n^{(1)}) G(w, Jx_n) + \alpha_n \beta_n^{(1)} G(w, Jx_0) \right\}, \\ x_{n+1} &= \Pi_{C_{n+1}}^f x_0, \quad n \geq 0, \end{aligned} \tag{3.1}$$

with the conditions

- (i) $\lim_{n \rightarrow \infty} \beta_n^{(1)} = 0$;
- (ii) $0 < b \leq \beta_n^{(2)} \leq 1$, $0 < d \leq \beta_n^{(3)} \leq 1$;
- (iii) $0 < \alpha \leq \alpha_n \leq 1$ for some $\alpha \in (0, 1)$.

Then, $\{x_n\}_{n=0}^\infty$ converges strongly to $\Pi_F^f x_0$.

Proof. We first show that C_n , for all $n \geq 0$ is closed and convex. It is obvious that $C_0 = C$ is closed and convex. Thus, we only need to show that C_n is closed and convex for each $n \geq 1$. Since $G(w, Jy_n) \leq (1 - \alpha_n \beta_n^{(1)}) G(w, Jx_n) + \alpha_n \beta_n^{(1)} G(w, Jx_0)$ is equivalent to

$$2 \left(\left\langle w, (1 - \alpha_n \beta_n^{(1)}) Jx_n + \alpha_n \beta_n^{(1)} Jx_0 - Jy_n \right\rangle \right) \leq (1 - \alpha_n \beta_n^{(1)}) \|x_n\|^2 + \alpha_n \beta_n^{(1)} \|x_0\|^2 - \|y_n\|^2. \tag{3.2}$$

This implies that C_{n+1} is closed and convex for all $n \geq 0$.

We next show that $F \subset C_n$, for all $n \geq 0$. For $n = 0$, we have $F \subset C = C_0$. Then for each $x^* \in F$, we obtain

$$\begin{aligned} G(x^*, Jy_n) &= G(x^*, (\alpha_n Jz_n + (1 - \alpha_n) Jx_n)) \\ &= \|x^*\|^2 - 2\alpha_n \langle x^*, Jz_n \rangle - 2(1 - \alpha_n) \langle x^*, Jx_n \rangle + \|\alpha_n Jz_n + (1 - \alpha_n) Jx_n\|^2 + 2\rho f(x^*) \\ &\leq \|x^*\|^2 - 2\alpha_n \langle x^*, Jz_n \rangle - 2(1 - \alpha_n) \langle x^*, Jx_n \rangle + \alpha_n \|Jz_n\|^2 + (1 - \alpha_n) \|Jx_n\|^2 + 2\rho f(x^*) \\ &= \alpha_n G(x^*, Jz_n) + (1 - \alpha_n) G(x^*, Jx_n) \\ &= (1 - \alpha_n) G(x^*, Jx_n) + \alpha_n G(x^*, \beta_n^{(1)} Jx_0 + \beta_n^{(2)} JT_n x_n + \beta_n^{(3)} JS_n x_n) \\ &\leq (1 - \alpha_n) G(x^*, Jx_n) \end{aligned}$$

$$\begin{aligned}
 & + \alpha_n \left(\|x^*\|^2 - 2\beta_n^{(1)} \langle x^*, Jx_0 \rangle - 2\beta_n^{(2)} \langle x^*, JT_n x_n \rangle - 2\beta_n^{(3)} \langle x^*, JS_n x_n \rangle \right. \\
 & \quad \left. + \beta_n^{(1)} \|x_0\|^2 + \beta_n^{(2)} \|T_n x_n\|^2 + \beta_n^{(3)} \|S_n x_n\|^2 + 2\rho f(x^*) \right) \\
 & = (1 - \alpha_n)G(x^*, Jx_n) + \alpha_n \left(\beta_n^{(1)} G(x^*, Jx_0) + \beta_n^{(2)} G(x^*, JT_n x_n) + \beta_n^{(3)} G(x^*, JS_n x_n) \right) \\
 & \leq (1 - \alpha_n)G(x^*, Jx_n) + \alpha_n \left(\beta_n^{(1)} G(x^*, Jx_0) + \beta_n^{(2)} G(x^*, Jx_n) + \beta_n^{(3)} G(x^*, Jx_n) \right) \\
 & \leq \left(1 - \alpha_n \beta_n^{(1)} \right) G(x^*, Jx_n) + \alpha_n \beta_n^{(1)} G(x^*, Jx_0).
 \end{aligned} \tag{3.3}$$

So, $x^* \in C_n$. This implies that $F \subset C_n$, for all $n \geq 0$. Since C_{n+1} is closed and convex for all $n \geq 0$ and $\emptyset \neq F \subset C_n$, for all $n \geq 0$, it follows that $\Pi_{C_{n+1}}^f x_0$ is well defined for all $n \geq 0$.

We now show that $\lim_{n \rightarrow \infty} G(x_n, Jx_0)$ exists. Since $f : E \rightarrow \mathbb{R}$ is a convex and lower semicontinuous, applying Lemma 2.5, we see that there exists $u^* \in E^*$ and $\alpha \in \mathbb{R}$ such that

$$f(y) \geq \langle y, u^* \rangle + \alpha, \quad \forall y \in E. \tag{3.4}$$

It follows that

$$\begin{aligned}
 G(x_n, Jx_0) & = \|x_n\|^2 - 2\langle x_n, Jx_0 \rangle + \|x_0\|^2 + 2\rho f(x_n) \\
 & \geq \|x_n\|^2 - 2\langle x_n, Jx_0 \rangle + \|x_0\|^2 + 2\rho \langle x_n, u^* \rangle + 2\rho\alpha \\
 & = \|x_n\|^2 - 2\langle x_n, Jx_0 - \rho u^* \rangle + \|x_0\|^2 + 2\rho\alpha \\
 & \geq \|x_n\|^2 - 2\|x_n\| \|Jx_0 - \rho u^*\| + \|x_0\|^2 + 2\rho\alpha \\
 & = (\|x_n\| - \|Jx_0 - \rho u^*\|)^2 + \|x_0\|^2 - \|Jx_0 - \rho u^*\|^2 + 2\rho\alpha.
 \end{aligned} \tag{3.5}$$

Since $x_n = \Pi_{C_n}^f x_0$, it follows from (3.5) that

$$G(x^*, Jx_0) \geq G(x_n, Jx_0) \geq (\|x_n\| - \|Jx_0 - \rho u^*\|)^2 + \|x_0\|^2 - \|Jx_0 - \rho u^*\|^2 + 2\rho\alpha \tag{3.6}$$

for each $x^* \in F$. This implies that $\{x_n\}_{n=0}^\infty$ is bounded and so is $\{G(x_n, Jx_0)\}_{n=0}^\infty$. By the construction of C_n , we have that $C_m \subset C_n$ and $x_m = \Pi_{C_m}^f x_0 \in C_n$ for any positive integer $m \geq n$. It then follows Lemma 2.7 that

$$\phi(x_m, x_n) + G(x_n, Jx_0) \leq G(x_m, Jx_0). \tag{3.7}$$

It is obvious that

$$\phi(x_m, x_n) \geq (\|x_m\| - \|x_n\|)^2 \geq 0. \tag{3.8}$$

In particular,

$$\begin{aligned}\phi(x_{n+1}, x_n) + G(x_n, Jx_0) &\leq G(x_{n+1}, Jx_0), \\ \phi(x_{n+1}, x_n) &\geq (\|x_{n+1}\| - \|x_n\|)^2 \geq 0,\end{aligned}\tag{3.9}$$

and so $\{G(x_n, Jx_0)\}_{n=0}^\infty$ is nondecreasing. It follows that the limit of $\{G(x_n, Jx_0)\}_{n=0}^\infty$ exists. Now, (3.7) implies that

$$\phi(x_m, x_n) \leq G(x_m, Jx_0) - G(x_n, Jx_0).\tag{3.10}$$

Taking the limit as $m, n \rightarrow \infty$ in (3.10), we obtain

$$\lim_{n \rightarrow \infty} \phi(x_m, x_n) = 0.\tag{3.11}$$

It then follows from Lemma 2.9 that $\|x_m - x_n\| \rightarrow 0$ as $m, n \rightarrow \infty$. Hence, $\{x_n\}_{n=0}^\infty$ is Cauchy. Since E is a Banach space and C is closed and convex, then there exists $p \in C$ such that $x_n \rightarrow p$ as $n \rightarrow \infty$.

Now since $\phi(x_m, x_n) \rightarrow 0$ as $m, n \rightarrow \infty$ we have in particular that $\phi(x_{n+1}, x_n) \rightarrow 0$ as $n \rightarrow \infty$ and this further implies that $\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0$. Since $x_{n+1} = \Pi_{C_{n+1}}^f x_0 \in C_{n+1}$, we have

$$\phi(x_{n+1}, y_n) \leq (1 - \alpha_n \beta_n^{(1)}) \phi(x_{n+1}, x_n) + \alpha_n \beta_n^{(1)} \phi(x_{n+1}, x_0), \quad \forall n \geq 0.\tag{3.12}$$

Then, we obtain

$$\lim_{n \rightarrow \infty} \phi(x_{n+1}, y_n) = 0.\tag{3.13}$$

Since E is uniformly convex and smooth, we have from Lemma 2.9 that

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0 = \lim_{n \rightarrow \infty} \|x_{n+1} - y_n\|.\tag{3.14}$$

So,

$$\|x_n - y_n\| \leq \|x_{n+1} - x_n\| + \|x_{n+1} - y_n\|.\tag{3.15}$$

Hence,

$$\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0.\tag{3.16}$$

Since J is uniformly norm-to-norm continuous on bounded sets and $\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0$, we obtain

$$\lim_{n \rightarrow \infty} \|Jx_n - Jy_n\| = 0.\tag{3.17}$$

Since $0 < \alpha \leq \alpha_n < 1$, then

$$\|Jz_n - Jx_n\| = \frac{1}{\alpha_n} \|Jx_n - Jy_n\| \longrightarrow 0, \quad \text{as } n \rightarrow \infty. \quad (3.18)$$

Since J^{-1} is uniformly norm-to-norm continuous on bounded sets, we have

$$\lim_{n \rightarrow \infty} \|z_n - x_n\| = 0, \quad (3.19)$$

so that $z_n \rightarrow p$ as $n \rightarrow \infty$. Since $\{x_n\}$ is bounded, so are $\{z_n\}$, $\{JT_n x_n\}$, and $\{JS_n x_n\}$.

Let $r := \sup_{n \geq 0} \{\|x_n\|, \|T_n x_n\|, \|S_n x_n\|\}$. Then from Lemma 2.10, we have

$$\begin{aligned} G(x^*, Jy_n) &= G(x^*, (\alpha_n Jz_n + (1 - \alpha_n)Jx_n)) \\ &= \|x^*\|^2 - 2\alpha_n \langle x^*, Jz_n \rangle - 2(1 - \alpha_n) \langle x^*, Jx_n \rangle + \|\alpha_n Jz_n + (1 - \alpha_n)Jx_n\|^2 + 2\rho f(x^*) \\ &\leq \|x^*\|^2 - 2\alpha_n \langle x^*, Jz_n \rangle - 2(1 - \alpha_n) \langle x^*, Jx_n \rangle + \alpha_n \|Jz_n\|^2 + (1 - \alpha_n) \|Jx_n\|^2 + 2\rho f(x^*) \\ &= \alpha_n G(x^*, Jz_n) + (1 - \alpha_n) G(x^*, Jx_n) \\ &= (1 - \alpha_n) G(x^*, Jx_n) + \alpha_n G\left(x^*, \left(\beta_n^{(1)} Jx_0 + \beta_n^{(2)} JT_n x_n + \beta_n^{(3)} JS_n x_n\right)\right) \\ &\leq (1 - \alpha_n) G(x^*, Jx_n) \\ &\quad + \alpha_n \left(\|x^*\|^2 - 2\beta_n^{(1)} \langle x^*, Jx_0 \rangle - 2\beta_n^{(2)} \langle x^*, JT_n x_n \rangle - 2\beta_n^{(3)} \langle x^*, JS_n x_n \rangle + \beta_n^{(1)} \|x_0\|^2 \right. \\ &\quad \left. + \beta_n^{(2)} \|T_n x_n\|^2 + \beta_n^{(3)} \|S_n x_n\|^2 - \beta_n^{(2)} \beta_n^{(3)} g(\|JT_n x_n - JS_n x_n\|) + 2\rho f(x^*) \right) \\ &= (1 - \alpha_n) G(x^*, Jx_n) + \alpha_n \left(\beta_n^{(1)} G(x^*, Jx_0) + \beta_n^{(2)} G(x^*, JT_n x_n) + \beta_n^{(3)} G(x^*, JS_n x_n) \right. \\ &\quad \left. - \beta_n^{(2)} \beta_n^{(3)} g(\|JT_n x_n - JS_n x_n\|) \right) \\ &\leq (1 - \alpha_n) G(x^*, Jx_n) + \alpha_n \left(\beta_n^{(1)} G(x^*, Jx_0) + \beta_n^{(2)} G(x^*, Jx_n) + \beta_n^{(3)} G(x^*, Jx_n) \right. \\ &\quad \left. - \beta_n^{(2)} \beta_n^{(3)} g(\|JT_n x_n - JS_n x_n\|) \right) \\ &\leq (1 - \alpha_n) G(x^*, Jx_n) + \beta_n^{(1)} G(x^*, Jx_0) + \alpha_n G(x^*, Jx_n) \\ &\quad - \alpha_n \beta_n^{(2)} \beta_n^{(3)} g(\|JT_n x_n - JS_n x_n\|) \\ &= \beta_n^{(1)} G(x^*, Jx_0) + G(x^*, Jx_n) - \alpha_n \beta_n^{(2)} \beta_n^{(3)} g(\|JT_n x_n - JS_n x_n\|). \end{aligned} \quad (3.20)$$

It then follows that

$$\alpha_n \beta_n^{(2)} \beta_n^{(3)} g(\|JT_n x_n - JS_n x_n\|) \leq \beta_n^{(1)} G(x^*, Jx_0) + G(x^*, Jx_n) - G(x^*, Jy_n). \quad (3.21)$$

But

$$\begin{aligned}
G(x^*, Jx_n) - G(x^*, Jy_n) &= \|x_n\|^2 - \|y_n\|^2 - 2\langle x^*, Jx_n - Jy_n \rangle \\
&\leq \left| \|x_n\|^2 - \|y_n\|^2 \right| + 2|\langle x^*, Jx_n - Jy_n \rangle| \\
&\leq \| \|x_n\| - \|y_n\| \| (\|x_n\| + \|y_n\|) + 2\|x^*\| \|Jx_n - Jy_n\| \\
&\leq \|x_n - y_n\| (\|x_n\| + \|y_n\|) + 2\|x^*\| \|Jx_n - Jy_n\|.
\end{aligned} \tag{3.22}$$

From $\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0$ and $\lim_{n \rightarrow \infty} \|Jx_n - Jy_n\| = 0$, we obtain

$$G(x^*, Jx_n) - G(x^*, Jy_n) \longrightarrow 0, \quad n \rightarrow \infty. \tag{3.23}$$

Using the condition $\liminf_{n \rightarrow \infty} \beta_n^{(2)} \beta_n^{(3)} > 0$ and $\alpha_n \geq \alpha > 0$, we have

$$\lim_{n \rightarrow \infty} g(\|JT_n x_n - JS_n x_n\|) = 0. \tag{3.24}$$

By property of g , we have $\lim_{n \rightarrow \infty} \|JT_n x_n - JS_n x_n\| = 0$. Since J^{-1} is also uniformly norm-to-norm continuous on bounded sets, we have

$$\lim_{n \rightarrow \infty} \|T_n x_n - S_n x_n\| = 0. \tag{3.25}$$

Furthermore,

$$\begin{aligned}
\|Jx_n - Jz_n\| &= \left\| Jx_n - \left(\beta_n^{(1)} Jx_0 + \beta_n^{(2)} JT_n x_n + \beta_n^{(3)} JS_n x_n \right) \right\| \\
&= \left\| \beta_n^{(1)} (Jx_n - Jx_0) + \beta_n^{(2)} (Jx_n - JT_n x_n) + \beta_n^{(3)} (Jx_n - JS_n x_n) \right\| \\
&\geq \left\| \beta_n^{(2)} (Jx_n - JT_n x_n) + \beta_n^{(3)} (Jx_n - JS_n x_n) \right\| - \left\| \beta_n^{(1)} (Jx_n - Jx_0) \right\|.
\end{aligned} \tag{3.26}$$

This implies that

$$\left\| \beta_n^{(2)} (Jx_n - JT_n x_n) + \beta_n^{(3)} (Jx_n - JS_n x_n) \right\| \leq \|Jx_n - Jz_n\| + \beta_n^{(1)} \|Jx_n - Jx_0\|. \tag{3.27}$$

Since $x_n \rightarrow p, z_n \rightarrow p$ and $\lim_{n \rightarrow \infty} \beta_n^{(1)} = 0$, it follows from (3.27) that

$$\lim_{n \rightarrow \infty} \left\| \beta_n^{(2)} (Jx_n - JT_n x_n) + \beta_n^{(3)} (Jx_n - JS_n x_n) \right\| = 0. \tag{3.28}$$

On the other hand, by using the property of norm, we obtain

$$\begin{aligned}
& \left\| \beta_n^{(2)}(Jx_n - JT_nx_n) + \beta_n^{(3)}(Jx_n - JS_nx_n) \right\| \\
&= \left\| \beta_n^{(2)}(Jx_n - JT_nx_n) + \beta_n^{(3)}(Jx_n - JS_nx_n) \right. \\
&\quad \left. + \beta_n^{(3)}(JT_nx_n - JS_nx_n) - \beta_n^{(3)}(JT_nx_n - JS_nx_n) \right\| \\
&= \left\| (\beta_n^{(2)} + \beta_n^{(3)})(Jx_n - JT_nx_n) + \beta_n^{(3)}(JT_nx_n - JS_nx_n) \right\| \\
&\geq (\beta_n^{(2)} + \beta_n^{(3)})\|Jx_n - JT_nx_n\| - \beta_n^{(3)}\|JT_nx_n - JS_nx_n\|.
\end{aligned} \tag{3.29}$$

This follows that

$$(\beta_n^{(2)} + \beta_n^{(3)})\|Jx_n - JT_nx_n\| \leq \left\| \beta_n^{(2)}(Jx_n - JT_nx_n) + \beta_n^{(3)}(Jx_n - JS_nx_n) \right\| + \beta_n^{(3)}\|JT_nx_n - JS_nx_n\|. \tag{3.30}$$

By (3.27) and $\lim_{n \rightarrow \infty} \|JT_nx_n - JS_nx_n\| = 0$, we have

$$\lim_{n \rightarrow \infty} (\beta_n^{(2)} + \beta_n^{(3)})\|Jx_n - JT_nx_n\| = 0. \tag{3.31}$$

Since $0 < b \leq \beta_n^{(2)} \leq 1$ and $0 < d \leq \beta_n^{(3)} \leq 1$, we have

$$\lim_{n \rightarrow \infty} \|x_n - T_nx_n\| = 0. \tag{3.32}$$

Similarly, we can show that

$$\lim_{n \rightarrow \infty} \|x_n - S_nx_n\| = 0. \tag{3.33}$$

Since $x_n \rightarrow p$ and $\{T_n\}, \{S_n\}$ are uniformly closed, we have $p \in (\bigcap_{n=0}^{\infty} F(T_n)) \cap (\bigcap_{n=0}^{\infty} F(S_n))$.

Finally, we show that $p = \Pi_F^f x_0$. Since $F = (\bigcap_{n=0}^{\infty} F(T_n)) \cap (\bigcap_{n=0}^{\infty} F(S_n))$ is a closed and convex set, from Lemma 2.6, we know that $\Pi_F^f x_0$ is single valued and denote $w = \Pi_F^f x_0$. Since $x_n = \Pi_{C_n}^f x_0$ and $w \in F \subset C_n$, we have

$$G(x_n, Jx_0) \leq G(w, Jx_0), \quad \forall n \geq 0. \tag{3.34}$$

We know that $G(\xi, J\varphi)$ is convex and lower semicontinuous with respect to ξ when φ is fixed. This implies that

$$G(p, Jx_0) \leq \liminf_{n \rightarrow \infty} G(x_n, Jx_0) \leq \limsup_{n \rightarrow \infty} G(x_n, Jx_0) \leq G(w, Jx_0). \tag{3.35}$$

From the definition of $\Pi_F^f x_0$ and $p \in F$, we see that $p = w$. This completes the proof. \square

Corollary 3.2. Let E be a uniformly convex real Banach space which is also uniformly smooth. Let C be a nonempty, closed, and convex subset of E . Suppose $\{T_n\}_{n=0}^{\infty}$ and $\{S_n\}_{n=0}^{\infty}$ are two countable families of weak relatively nonexpansive mappings of C into itself such that $F := (\bigcap_{n=0}^{\infty} F(T_n)) \cap (\bigcap_{n=0}^{\infty} F(S_n)) \neq \emptyset$. Suppose $\{x_n\}_{n=0}^{\infty}$ is iteratively generated by $x_0 \in C$, $C_0 = C$

$$\begin{aligned} z_n &= J^{-1}(\beta_n^{(1)} Jx_0 + \beta_n^{(2)} JT_n x_n + \beta_n^{(3)} JS_n x_n), \\ y_n &= J^{-1}(\alpha_n Jz_n + (1 - \alpha_n) Jx_n), \\ C_{n+1} &= \left\{ w \in C_n : \phi(w, y_n) \leq (1 - \alpha_n \beta_n^{(1)}) \phi(w, x_n) + \alpha_n \beta_n^{(1)} \phi(w, x_0) \right\}, \\ x_{n+1} &= \Pi_{C_{n+1}} x_0, \quad n \geq 0, \end{aligned} \tag{3.36}$$

with the conditions

- (i) $\lim_{n \rightarrow \infty} \beta_n^{(1)} = 0$;
- (ii) $0 < b \leq \beta_n^{(2)} \leq 1$, $0 < d \leq \beta_n^{(3)} \leq 1$;
- (iii) $0 < \alpha \leq \alpha_n \leq 1$ for some $\alpha \in (0, 1)$.

Then, $\{x_n\}_{n=0}^{\infty}$ converges strongly to $\Pi_F x_0$.

Proof. Take $f(x) = 0$ for all $x \in E$ in Theorem 3.1, $G(\xi, Jx) = \phi(\xi, x)$ and $\Pi_C^f x_0 = \Pi_C x_0$. Then, the desired conclusion follows. \square

Remark 3.3. Our Corollary 3.2 extends and improves on Theorem 1.5. In fact, the iterative procedure (3.36) is simpler than (1.8) in the following two aspects: (a) the process of computing $Q_n = \{w \in C_{n-1} \cap Q_{n-1} : \langle x_n - w, Jx_0 - Jx_n \rangle \geq 0\}$ is removed; (b) the process of computing $\Pi_{C_n \cap Q_n}$ is replaced by computing Π_{C_n} .

4. Applications

A mapping H from E to E^* is said to be

- (i) monotone if $\langle Hx - Hy, x - y \rangle \geq 0$, for all $x, y \in E$;
- (ii) strictly monotone if H is monotone and $\langle Hx - Hy, x - y \rangle = 0$ if and only if $x = y$;
- (iii) β -Lipschitz continuous if there exists a constant $\beta \geq 0$ such that $\|Hx - Hy\| \leq \beta \|x - y\|$, for all $x, y \in E$.

Let M be a set valued mapping from E to E^* with domain $D(M) = \{z \in E : Mz \neq \emptyset\}$ and range $R(M) = \bigcup \{Mz : z \in D(M)\}$. A set-valued mapping M is said to be

- (i) monotone if $\langle x_1 - x_2, y_1 - y_2 \rangle \geq 0$ for each $x_i \in D(M)$ and $y_i \in Mx_i$, $i = 1, 2$,
- (ii) r -strongly monotone if $\langle x_1 - x_2, y_1 - y_2 \rangle \geq r \|x_1 - x_2\|^2$ for each $x_i \in D(M)$ and $y_i \in Mx_i$, $i = 1, 2$,
- (iii) maximal monotone if M is monotone and its graph $G(M) := \{(x, y) : y \in Mx\}$ is not properly contained in the graph of any other monotone operator,
- (iv) a general H -monotone if M is monotone and $(H + \lambda M)E = E^*$ holds for every $\lambda > 0$, where H is a mapping from E to E^* .

We denote the set $\{x \in E : 0 \in Mx\}$ by $M^{-1}0$. From Li et al. [15], we know that if $H : E \rightarrow E^*$ is strictly monotone and $M : E \rightarrow 2^{E^*}$ is general H -monotone mapping, then $M^{-1}0$ is closed and convex. Furthermore, for every $\lambda > 0$ and $x^* \in E^*$, there exists a unique $x \in D(M)$ such that $x = (H + \lambda M)^{-1}x^*$. Thus, we can define a single-value mapping $T_\lambda : E \rightarrow D(M)$ by $T_\lambda x = (H + \lambda M)^{-1}Hx$. It is obvious that $M^{-1}0 = F(T_\lambda)$ for all $\lambda > 0$.

Lemma 4.1 (Alber, [16]). *If E is a uniformly convex and uniformly smooth Banach space, $\delta_E(\epsilon)$ is the modulus of convexity of E and $\rho_E(t)$ is the modulus of smoothness of E , then the inequalities*

$$8d^2\delta_E\left(\frac{\|x - \xi\|}{4d}\right) \leq \phi(x, \xi) \leq 4d^2\rho_E\left(\frac{4\|x - \xi\|}{d}\right) \tag{4.1}$$

hold for all x and ξ in E , where $d = \sqrt{(\|x\|^2 + \|\xi\|^2)/2}$.

Lemma 4.2 (Xia and Huang, [22]). *Let E be a Banach space with dual space E^* , $H : E \rightarrow E^*$ a strictly monotone mapping and $M : E \rightarrow 2^{E^*}$ a general H -monotone mapping. Then*

- (i) $(H + \lambda M)^{-1}$ is a single valued mapping;
- (ii) if E is reflexive and $M : E \rightarrow 2^{E^*}$ is r -strongly monotone, $(H + \lambda M)^{-1}$ is Lipschitz continuous with constant $1/(\lambda r)$, where $r > 0$.

Theorem 4.3. *Let E be a uniformly convex real Banach space which is also uniformly smooth with $\delta_E(\epsilon) \geq k\epsilon^2$ and $\rho_E(t) \leq ct^2$ for some $k, c > 0$. Suppose $H : E \rightarrow E^*$ is a strictly monotone and β -Lipschitz continuous mapping and $M_i : E \rightarrow 2^{E^*}$ is a general H -monotone mapping and r_i -strongly monotone mapping with $r_i > 0$, $i = 1, 2$ such that $F := M_1^{-1}0 \cap M_2^{-1}0 \neq \emptyset$. Let $T_\lambda^{M_i} = (H + \lambda M_i)^{-1}H$, $i = 1, 2$ and $f : E \rightarrow \mathbb{R}$ be a convex and lower semicontinuous mapping with $D(f) = E$ and suppose for each $n \geq 0$, there exists a $\lambda_n > 0$ such that $64c\beta^2 \leq \min\{(1/2)k\lambda_n^2 r_1^2, (1/2)k\lambda_n^2 r_2^2\}$. Let $\{x_n\}_{n=0}^\infty$ be iteratively generated by $x_0 \in E$, $C_0 = E$,*

$$\begin{aligned} z_n &= J^{-1}\left(\beta_n^{(1)}Jx_0 + \beta_n^{(2)}JT_{\lambda_n}^{M_1}x_n + \beta_n^{(3)}JT_{\lambda_n}^{M_2}x_n\right), \\ y_n &= J^{-1}(\alpha_n Jx_n + (1 - \alpha_n)Jz_n), \\ C_{n+1} &= \left\{w \in C_n : G(w, Jy_n) \leq (1 - \alpha_n\beta_n^{(1)})G(w, Jx_n) + \alpha_n\beta_n^{(1)}G(w, Jx_0)\right\}, \\ x_{n+1} &= \Pi_{C_{n+1}}^f x_0, \quad n \geq 0, \end{aligned} \tag{4.2}$$

with the conditions

- (i) $\lim_{n \rightarrow \infty} \beta_n^{(1)} = 0$;
- (ii) $0 < b \leq \beta_n^{(2)} \leq 1$, $0 < d \leq \beta_n^{(3)} \leq 1$;
- (iii) $0 < \alpha \leq \alpha_n \leq 1$ for some $\alpha \in (0, 1)$;
- (iv) $\liminf_{n \rightarrow \infty} \lambda_n > 0$.

Then, $\{x_n\}_{n=0}^\infty$ converges strongly to $\Pi_F^f x_0$.

Proof. We only need to prove that $\{T_{\lambda_n}^{M_1}\}$ and $\{T_{\lambda_n}^{M_2}\}$ are countable families of weak relatively nonexpansive mappings with common fixed points sets $\bigcap_{n=0}^{\infty} F(T_{\lambda_n}^{M_1}) = M_1^{-1}0$ and $\bigcap_{n=0}^{\infty} F(T_{\lambda_n}^{M_2}) = M_2^{-1}0$, respectively. Firstly, we have $\bigcap_{n=0}^{\infty} F(T_{\lambda_n}^{M_1}) = M_1^{-1}0 \neq \emptyset$. Secondly, we show that $\phi(p, T_{\lambda_n}^{M_1}w) \leq \phi(p, w)$, for all $w \in E$, $p \in F(T_{\lambda_n}^{M_1})$, $n \geq 0$. Now, by Lemma 4.2 and the Lipschitz continuity of H , we have

$$\begin{aligned} \left\| T_{\lambda_n}^{M_1} p - T_{\lambda_n}^{M_1} w \right\| &= \left\| (H + \lambda_n M_1)^{-1} H p - (H + \lambda_n M_1)^{-1} H w \right\| \\ &\leq \frac{1}{\lambda_n r_1} \|H p - H w\| \\ &\leq \frac{\beta}{\lambda_n r_1} \|p - w\|. \end{aligned} \quad (4.3)$$

By (4.3) and Lemma 4.1,

$$\begin{aligned} \phi(p, T_{\lambda_n}^{M_1} w) &= \phi(T_{\lambda_n}^{M_1} p, T_{\lambda_n}^{M_1} w) \\ &\leq 4d^2 \rho_E \left(\frac{4 \left\| T_{\lambda_n}^{M_1} p - T_{\lambda_n}^{M_1} w \right\|}{d} \right) \\ &\leq 64c \left\| T_{\lambda_n}^{M_1} p - T_{\lambda_n}^{M_1} w \right\|^2 \\ &\leq \frac{64c\beta^2}{\lambda_n^2 r_1^2} \|p - w\|^2, \\ \phi(p, w) &\geq 8d^2 \delta_E \left(\frac{\|p - w\|}{4d} \right) \geq \frac{1}{2} k \|p - w\|^2. \end{aligned} \quad (4.4)$$

Since $64c\beta^2 \leq (1/2)k\lambda_n^2 r_1^2$, it follows from (4.4) that $\phi(p, T_{\lambda_n}^{M_1} w) \leq \phi(p, w)$, for all $w \in E$, $p \in F(T_{\lambda_n}^{M_1})$, $n \geq 0$. Thirdly, we show that $\tilde{F}(\{T_{\lambda_n}^{M_1}\}) = \bigcap_{n=0}^{\infty} F(T_{\lambda_n}^{M_1}) = M_1^{-1}0$. We first show that $\tilde{F}(\{T_{\lambda_n}^{M_1}\}) \subset M_1^{-1}0$. Let $p \in \tilde{F}(\{T_{\lambda_n}^{M_1}\})$, then there exists $\{x_n\} \subset E$ such that $x_n \rightarrow p$ and $\lim_{n \rightarrow \infty} \|x_n - T_{\lambda_n}^{M_1} x_n\| = 0$. Since H is β -Lipschitz continuous,

$$\left\| H x_n - H T_{\lambda_n}^{M_1} x_n \right\| \leq \beta \left\| x_n - T_{\lambda_n}^{M_1} x_n \right\|. \quad (4.5)$$

Letting $n \rightarrow \infty$, we obtain

$$\frac{1}{\lambda_n} \left(H x_n - H T_{\lambda_n}^{M_1} x_n \right) \rightarrow 0. \quad (4.6)$$

It follows from $(1/\lambda_n)(Hx_n - HT_{\lambda_n}^{M_1}x_n) \in M_1T_{\lambda_n}^{M_1}x_n$ and the monotonicity of M_1 that

$$\left\langle x - T_{\lambda_n}^{M_1}x_n, x^* - \frac{1}{\lambda_n}(Hx_n - HT_{\lambda_n}^{M_1}x_n) \right\rangle \geq 0 \quad (4.7)$$

for all $x \in D(M_1)$ and $x^* \in M_1x$. Taking the limit as $n \rightarrow \infty$, we obtain

$$\langle x - p, x^* \rangle \geq 0 \quad (4.8)$$

for all $x \in D(M_1)$ and $x^* \in M_1x$. By the maximality of M_1 , we know that $p \in M_1^{-1}0$. On the other hand, we know that $F(T_{\lambda_n}^{M_1}) = M_1^{-1}0$, $F(T_{\lambda_n}^{M_1}) \subset \tilde{F}(T_{\lambda_n}^{M_1})$ for all $n \geq 0$, therefore, $M_1^{-1}0 = \bigcap_{n=0}^{\infty} F(T_{\lambda_n}^{M_1}) = \tilde{F}(\bigcap_{n=0}^{\infty} T_{\lambda_n}^{M_1})$. Thus, we have proved that $\{T_{\lambda_n}^{M_1}\}$ is a countable family of weak relatively nonexpansive mappings with common fixed points sets $\bigcap_{n=0}^{\infty} F(T_{\lambda_n}^{M_1}) = M_1^{-1}0$. By following the same arguments, we can show that $\{T_{\lambda_n}^{M_2}\}$ is a countable family of weak relatively nonexpansive mappings with common fixed points sets $\bigcap_{n=0}^{\infty} F(T_{\lambda_n}^{M_2}) = M_2^{-1}0$. \square

Let E be a uniformly convex and uniformly smooth Banach space, $H = J$ and M be a maximal monotone mapping. Then, we can define $J_\lambda = (J + \lambda M)^{-1}J$ for all $\lambda > 0$. We know that J_λ is relatively nonexpansive and therefore weak relatively nonexpansive and $M^{-1}0 = F(J_\lambda)$ for all $\lambda > 0$ (see, e.g., [2]), where $F(J_\lambda)$ denotes the fixed points set of J_λ . By Corollary 3.2, we obtain the following theorem.

Theorem 4.4. *Let E be a uniformly convex real Banach space which is also uniformly smooth. For each $i = 1, 2$, let $M_i \subset E \times E^*$ be a maximal monotone operator and let $J_\lambda^{M_i} = (J + \lambda M_i)^{-1}J$ for all $\lambda > 0$ and suppose C is a nonempty closed and convex subset of E such that $D(M_i) \subset C \subset J^{-1}(\bigcap_{\lambda>0} R(J + \lambda M_i))$ and $F := M_1^{-1}0 \cap M_2^{-1}0 \neq \emptyset$. Let $\{x_n\}_{n=0}^{\infty}$ be iteratively generated by $x_0 \in E$, $C_0 = E$,*

$$\begin{aligned} z_n &= J^{-1}\left(\beta_n^{(1)}Jx_0 + \beta_n^{(2)}JJT_{\lambda_n}^{M_1}x_n + \beta_n^{(3)}JJT_{\lambda_n}^{M_2}x_n\right), \\ y_n &= J^{-1}(\alpha_nJx_n + (1 - \alpha_n)Jz_n), \\ C_{n+1} &= \left\{w \in C_n : \phi(w, y_n) \leq \left(1 - \alpha_n\beta_n^{(1)}\right)\phi(w, x_n) + \alpha_n\beta_n^{(1)}\phi(w, x_0)\right\}, \\ x_{n+1} &= \Pi_{C_{n+1}}x_0, \quad n \geq 0, \end{aligned} \quad (4.9)$$

with the conditions

- (i) $\lim_{n \rightarrow \infty} \beta_n^{(1)} = 0$;
- (ii) $0 < b \leq \beta_n^{(2)} \leq 1$, $0 < d \leq \beta_n^{(3)} \leq 1$;
- (iii) $0 < \alpha \leq \alpha_n \leq 1$ for some $\alpha \in (0, 1)$;
- (iv) $\liminf_{n \rightarrow \infty} \lambda_n > 0$.

Then, $\{x_n\}_{n=0}^{\infty}$ converges strongly to $\Pi_F x_0$.
