Our aim is to establish a tripled fixed and coincidence point result on generalized $C^*$-algebra-valued metric spaces. We present an example on matrices. At the end, we give an application on integral equations.

1. Introduction

The Banach contraction principle (BCP) was considered by Perov [1] on spaces equipped with vector-valued metrics. The result of Perov has been generalized in [2], and its related fixed point property on generalized metric spaces was investigated.

Let $A$ be a unital algebra with the unit $\iota$ and $\theta$ be its zero element. An involution on $A$ is a conjugate linear map $\iota \mapsto \iota^*$ on $A$ so that for all $i, \kappa \in A$, $i^{**} = i$ and $(\iota \kappa)^* = \kappa^* \iota^*$. The pair $(A, \iota)$ is named as an $\iota$-algebra. A Banach $\iota$-algebra is an $\iota$-algebra $A$ with the complete submultiplicative norm so that $||i^*|| = ||i||$ for all $i \in A$. A $C^*$-algebra is a Banach $\iota$-algebra such that $||i^*i|| = ||i||^2$ for all $i \in A$. Let $H$ be a Hilbert space and $B(H)$ be the family of all bounded linear operators on $H$; then, $B(H)$ is a $C^*$-algebra with the operator norm. Let $A_{sa}$ be the family of all self-adjoint elements in $A$, and define the spectrum of $i \in A$ as $\sigma(i) = \{ \lambda \in \mathbb{C} : \lambda I - i \text{ is not invertible} \}$. An element $i \in A$ is positive (denoted by $i \geq \theta$) if $i \in A_{sa}$ and $\sigma(i) \subseteq \mathbb{R}_+$. Take $A_0 = \{ i \in A : i \geq \theta \}$, then $A_+ = \{ i^*: i \in A \}$ (see [3]). One can define a partial ordering $\leq_{\iota}$ on $A_{sa}$ as $i \leq_{\iota} k$ iff $k - i \geq_{\iota} \theta$. If $i, \kappa \in A_{sa}$ and $c \in A$, then $\iota \leq_{\iota} \kappa \Rightarrow c^* \iota c \leq c^* \kappa c$, and if $i, \kappa \in A$, are invertible, then $\iota \leq_{\iota} \kappa \Rightarrow \theta \leq \kappa^{-1} \leq \iota^{-1}$.

Definition 1 (see [4]). Let $X$ be a nonempty set. If the function $U : X \times X \rightarrow A$ is so that for all $u, \tau, \eta \in X$:

(i) $\theta \leq U(u, \tau)$ and $U(u, \tau) = \theta$ iff $\tau = \tau$
(ii) $U(u, \tau) = f(\tau, \nu)$
(iii) $U(u, \sigma) \leq U(u, \eta) + U(\eta, \tau)$

then $(X, A, U)$ is named as a $C^*$-algebra-valued metric space.

In this article, denote by $M_{q,q}(A)$ the set of all $q \times q$ matrices with coefficients in $A$. Note that $\Theta$ is the zero matrix and $I$ is the identity matrix.

Let $\mathcal{A} \in M_{q,q}(A)$, then $A$ is said to be convergent to zero, iff $A^n$ goes to $\theta$ as $n \rightarrow \infty$. See [5–8] for more details.

Denote by $ZM$ the family of all matrices $\mathcal{A} \in M_{q,q}(A)$ so that $A^n \rightarrow \theta$. We provide the following examples.
Example 1.

$\mathcal{A} = \frac{1}{4} \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$, 

$\mathcal{B} = \frac{1}{6} \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$

are in $ZM$. We have $(\mathcal{A} + \mathcal{B})^2 (I - A^2)^{-1} \in ZM$.

Example 2.

$\mathcal{A} = \begin{pmatrix} 1 & 0 \\ 0 & 1/3 \end{pmatrix}$, 

$\mathcal{B} = \begin{pmatrix} 0 & 1/3 \\ 1/3 & 0 \end{pmatrix}$

are in $ZM$. Clearly, $(\mathcal{A} + \mathcal{B})^2 (I - A^2)^{-1} \in ZM$.

Example 3. Let $A = \alpha I$ and $B = (I - \alpha^2) - \alpha I$ are in $ZM$. Then, for $\alpha \in \{1/4, 1/5, 1/7, 1/8\}$, one gets $(\mathcal{A} + \mathcal{B})^2 (I - A^2)^{-1} \in ZM$.

Definition 2 (see [9]). An element $(l_1, l_2) \in X^2$ is named to be a coupled fixed point of $F : X^2 \rightarrow X$ if $F(l_1, l_2) = l_1$ and $F(l_2, l_1) = l_2$.

Definition 3 (see [10]; see also [11]). Given $F : X^2 \rightarrow X$ and $g : X \rightarrow X$. An element $(l_1, l_2) \in X^2$ so that $F(l_1, l_2) = gl_1$ and $F(l_2, l_1) = gl_2$ is named as a coupled coincidence point of $F$ and $g$. $(gl_1, gl_2)$ is called a coupled point of coincidence.

Definition 4 (see [12]). An element $(l_1, l_2, l_3) \in X^3$ is named to be a tripled fixed point of $F : X^3 \rightarrow X$ if $F(l_1, l_2, l_3) = l_1$, $F(l_2, l_1, l_3) = l_2$ and $F(l_3, l_2, l_1) = l_3$.

In this manuscript, we investigate a tripled common fixed point result for a sequence of mappings $T_n : X^3 \rightarrow X$ and $g : X \rightarrow X$ in the class of complete $C^*$-algebra-valued metric spaces. An example and an application are presented.

2. Main Results

Our main result is as follows.

Theorem 5. Let $(X, A, U)$ be a complete $C^*$-algebra-valued metric space. Let $g : X \rightarrow X$ and $\{T_n\}_{n \geq 0}$ be a sequence of mappings from $X^3$ into $X$ so that

\[
\begin{align*}
U(T_i(l_1, l_2, l_3), T_j(u_1, u_2, u_3)) & \leq \mathcal{A}[U(g(l_1), T_i(l_1, l_2, l_3))] \\
& + U(gu_1, T_j(u_1, u_2, u_3))|\mathcal{A}^* + \mathcal{B}[U(gl_1, gl_1)]|\mathcal{B}^*,
\end{align*}
\]

where $I \neq \mathcal{A} = (a_{ij}) \in M_{qq}(A)$, $I \neq \mathcal{B} = (b_{ij}) \in M_{qq}(A)$, with $(\mathcal{A} + \mathcal{B})^2 (I - A^2)^{-1} \in ZM$. If $T_i(X^3) \subseteq g(X)$ and $g(X)$ is complete in $X$, then $\{T_n\}_{n \geq 0}$ and $g$ have a tripled coincidence point. Further, if $\{T_n\}_{n \geq 0}$ and $g$ are $w$-compatible, then they have a unique tripled common fixed point in $X$.

Proof. Take $l_0, l_0, l_0 \in X$, and let

\[
\begin{align*}
gl_1 &= T_0(l_0, l_0, l_0), \\
gl_1 &= T_0(l_0, l_0, l_0), \\
gl_1 &= T_0(l_0, l_0, l_0).
\end{align*}
\]

Continuing this technique, we get

\[
\begin{align*}
gl_{n+1} &= T_n(l_n, l_n, l_n), \\
gl_{n+1} &= T_n(l_n, l_n, l_n), \\
gl_{n+1} &= T_n(l_n, l_n, l_n),
\end{align*}
\]

for all $n \geq 0$.

By (3), we get

\[
\begin{align*}
\mathcal{A}(gl_{n+1}, gl_{n+1}) &= U(T_{n+1}(l_{n+1}, l_{n+1}, l_{n+1}), T_{n+1}(l_{n+1}, l_{n+1}, l_{n+1})) \\
& \leq \mathcal{A}[U(g(l_{n+1}), T_{n+1}(l_{n+1}, l_{n+1}, l_{n+1}))] \\
& + U(gl_{n+1}, T_{n+1}(l_{n+1}, l_{n+1}, l_{n+1}))|\mathcal{A}^* + \mathcal{B}[U(gl_{n+1}, gl_{n+1})]|\mathcal{B}^*
\end{align*}
\]

It follows that

\[
\begin{align*}
U(gl_{n+1}, gl_{n+1}) & \leq (\mathcal{A} + \mathcal{B})^2 (I - A^2)^{-1} U(gl_{n+1}, gl_{n+1}).
\end{align*}
\]

Similarly,

\[
\begin{align*}
U(gl_{n+1}, gl_{n+1}) & \leq (\mathcal{A} + \mathcal{B})^2 (I - A^2)^{-1} U(gl_{n+1}, gl_{n+1}).
\end{align*}
\]
\(\mathcal{U}(g^{t_n}, g^{t_{n+1}}) \leq (\mathcal{A} + \mathcal{B}^2)(I - \mathcal{A}^2)^{-1}\mathcal{U}(g^{t_n}, g^{t_n}).\)  

Adding (7), (8), and (9), we have
\[
\delta_n = \mathcal{U}(g^{t_1}, g^{t_{n+1}}) + \mathcal{U}(g^{t_1}, g^{t_{n+1}}) + \mathcal{U}(g^{t_1}, g^{t_{n+1}}) \\
\leq (\mathcal{A} + \mathcal{B}^2)(I - \mathcal{A}^2)^{-1}\mathcal{U}(g^{t_n}, g^{t_n} + \mathcal{U}(g^{t_n}, g^{t_n}) \\
+ \mathcal{U}(g^{t_{n-1}}, g^{t_n}) = (\mathcal{A} + \mathcal{B}^2)(I - \mathcal{A}^2)^{-1}\delta_{n-1}.
\]

Put \(C = (\mathcal{A} + \mathcal{B}^2)(I - \mathcal{A}^2)^{-1}.\) Then, for all \(n \geq 2,
\Theta \leq \delta_n \leq C\delta_{n-1} \leq C^2\delta_{n-2} \leq \cdots \leq C^n\delta_0.
\]

Using the triangle inequality, for all \(p \geq 1,
\mathcal{U}(g^{t_n}, g^{t_{n+p}}) + \mathcal{U}(g^{t_n}, g^{t_{n+p}}) + \mathcal{U}(g^{t_n}, g^{t_{n+p}}) \\
\leq \mathcal{U}(g^{t_1}, g^{t_{n+1}}) + \mathcal{U}(g^{t_1}, g^{t_{n+1}}) + \mathcal{U}(g^{t_1}, g^{t_{n+1}}) \\
+ \mathcal{U}(g^{t_{n+1}}, g^{t_{n+2}}) + \mathcal{U}(g^{t_{n+2}}, g^{t_{n+3}}) + \mathcal{U}(g^{t_{n+3}}, g^{t_{n+4}}) \\
+ \cdots \mathcal{U}(g^{t_{n+p-1}}, g^{t_{n+p}}) + \mathcal{U}(g^{t_{n+p-1}}, g^{t_{n+p}}) \\
+ \mathcal{U}(g^{t_{n+p-1}}, g^{t_{n+p}}) = \delta_n + \delta_{n+1} + \cdots + \delta_{n+p-1} \\
\leq C^n(I + C + \cdots + C^{n-1})C^n = C^n(I - C)^{-1}\delta_0.
\]

We have
\[
\left\| \mathcal{U}(g^{t_n}, g^{t_{n+p}}) + \mathcal{U}(g^{t_n}, g^{t_{n+p}}) + \mathcal{U}(g^{t_n}, g^{t_{n+p}}) \right\| \\
\leq C^n(I - C)^{-1}\delta_0 = \left\| (\mathcal{A} + \mathcal{B}^2)(I - \mathcal{A}^2)^{-1} \right\| n \\
\cdot \left( I - (\mathcal{A} + \mathcal{B}^2)(I - \mathcal{A}^2)^{-1} \right)^{-1}\delta_0.
\]

Now, taking the limit as \(n \to +\infty,\) we conclude
\[
\left\| \mathcal{U}(g^{t_n}, g^{t_{n+p}}) + \mathcal{U}(g^{t_n}, g^{t_{n+p}}) + \mathcal{U}(g^{t_n}, g^{t_{n+p}}) \right\| \\
\leq \left\| (\mathcal{A} + \mathcal{B}^2)(I - \mathcal{A}^2)^{-1} \right\| n \left( I - (\mathcal{A} + \mathcal{B}^2)(I - \mathcal{A}^2)^{-1} \right)^{-1}\delta_0 \\
\cdot \delta_0 \to 0.
\]

This implies that
\[
\left\| \mathcal{U}(g^{t_n}, g^{t_{n+p}}) \right\| = \left\| \mathcal{U}(g^{t_n}, g^{t_{n+p}}) \right\| = \left\| \mathcal{U}(g^{t_n}, g^{t_{n+p}}) \right\| = 0.
\]

\[
\lim_{n \to +\infty} \left\{ g^{t_n} \right\} = g^{t_1} = \ell^1, \\
\lim_{n \to +\infty} \left\{ g^{t_n} \right\} = g^{t_2} = \ell^2, \\
\lim_{n \to +\infty} \left\{ g^{t_n} \right\} = g^{t_3} = \ell^3.
\]

We have
\[
\mathcal{U}(T_i(t^1, t^2, t^3), g^t) \leq \mathcal{U}(T_i(t^1, t^2, t^3), g^t) + \mathcal{U}(g^t, g^t) \\
= \mathcal{U}(T_i(t^1, t^2, t^3), g^t) + \mathcal{U}(g^t, g^t) \\
\leq \mathcal{A}^* \mathcal{U}(g^t, T_i(t^1, t^2, t^3)) + \mathcal{U}(g^t, T_j(t^1, t^2, t^3))) + \mathcal{A}^* \\
+ \mathcal{B}(g^t, g^t)\mathcal{B}^* + \mathcal{U}(g^t, g^t).
\]

Taking the limit as \(n \to +\infty,\) we obtain \(g^{\ell^1} = T_i(t^1, t^2, t^3).\) Similarly, \(g^{\ell^2} = T_j(t^1, t^2, t^3)\) and \(g^{\ell^3} = T_j(t^1, t^2, t^3).\) Therefore, \((\ell^1, \ell^2, \ell^3)\) is a tripled coincidence point of \(\{T_i\}_{i \in \mathbb{N}}\) and \(g.\)

Let \((\ell^1, \ell^2, \ell^3)\) and \((\ell^1, \ell^2, \ell^3)\) be tripled coincidence points, then
\[
\mathcal{U}(g^{\ell^1}, g^{\ell^1}) = \mathcal{U}(T_i(t^1, t^2, t^3), T_j(t^1, t^2, t^3))) + \mathcal{U}(g^p, T_j(t^1, t^2, t^3))) + \mathcal{A}^* \\
+ \mathcal{B}(g^p, g^p)\mathcal{B}^* + \mathcal{U}(g^p, g^p).
\]

That is,
\[
(I - \mathcal{B}^2)\mathcal{U}(g^{\ell^1}, g^{\ell^1}) \leq \mathcal{A}^* (I - \mathcal{B}^2)^{-1}[\mathcal{U}(g^{\ell^1}, T_i(t^1, t^2, t^3))) + \mathcal{U}(g^p, T_j(t^1, t^2, t^3))) + \mathcal{A}^* \\
+ \mathcal{B}(g^p, g^p)\mathcal{B}^* + \mathcal{U}(g^p, g^p).
\]

which further induces that
\[
\left\| \mathcal{U}(g^{\ell^1}, g^{\ell^1}) \right\| \leq \left\| (I - \mathcal{B}^2)^{-1} \right\| \left\| \mathcal{U}(g^{\ell^1}, T_i(t^1, t^2, t^3))) + \mathcal{U}(g^p, T_j(t^1, t^2, t^3))) + \mathcal{A}^* \\
+ \mathcal{B}(g^p, g^p)\mathcal{B}^* + \mathcal{U}(g^p, g^p) \right\|.
\]

Therefore, \(\mathcal{U}(g^{\ell^1}, g^{\ell^1}) = 0,\) that is, \(g^{\ell^1} = g^{\ell^1}.\) Similarly, we can prove that \(g^{\ell^2} = g^{\ell^2}\) and \(g^{\ell^3} = g^{\ell^3}.\) So, \(g^{\ell^1} = g^{\ell^2} = g^{\ell^3} = g^{\ell^2} = g^{\ell^3} = g^{\ell^3}\). Therefore, \(\{T_i\}_{i \in \mathbb{N}}\) and \(g\) have a unique tripled coincidence point, \((g^{\ell^1}, g^{\ell^1}, g^{\ell^1}).\) Now, set \(g = t^1\) and \(u = t^1\). Then \(u = g^{\ell^1} = T_i(t^1, t^2, t^3).\) By \(\psi\)-compatibility of \(\{T_i\}_{i \in \mathbb{N}}\) and \(g\),
\[
gu = g^{\ell^1} = g(T_i(t^1, t^2, t^3)) = T_i(t^1, t^2, t^3) = T_i(u, u, u) = g^{\ell^1}.
\]
Then, \((gu, gu, gu)\) is a tripled coincidence point of \(\{T_i\}_{i \in \mathbb{N}}\) and \(g\). By the uniqueness, we know \(gu = gt^1\), which yields that \(u = gu = T_i(u, u)\). Hence, \((u, u, u)\) is a unique tripled common fixed point of \(\{T_i\}_{i \in \mathbb{N}}\) and \(g\).

Letting \(g = I_{\Omega} \) in Theorem 5, we have the following.

**Corollary 6.** Let \((X, A, U)\) be a complete generalized \(C^*\)-algebra-valued metric space. Suppose that \(\{T_i\}_{i \in \mathbb{N}}\) is a sequence of mappings from \(X^3\) into \(X\) so that

\[
\begin{align*}
\mathcal{U}(T_i(t^1, t^2, t^3), T_j(u^1, u^2, u^3)) &\leq \mathcal{A} \mathcal{U}(t^1, T_i(t^1, t^2, t^3)) + \mathcal{U}(u^1, T_j(u^1, u^2, u^3)) \mathcal{A} + \mathcal{B} \mathcal{U}(u^1, t^1) \mathcal{B}^*, \\
\mathcal{A} &\in \mathcal{B}
\end{align*}
\]

where \(\mathcal{A}, \mathcal{B} \in A\) with \(i \neq \mathcal{A} = (a_{ij}), i \neq \mathcal{B} = (b_{ij}) \in M_{m,n}(A_i), (\mathcal{A} + \mathcal{B})^2(1 - \mathcal{A}^2)^{-1} \in ZM\). Then, \(\{T_i\}_{i \in \mathbb{N}}\) has a unique tripled fixed point.

**Example 4.** Take \(X = [0, 1]\). Given

\[
\begin{align*}
\mathcal{U}(t^1, t^2) &\leq \begin{pmatrix} |t^1 - t^2| & 0 \\
0 & |t^1 - t^2| \end{pmatrix}.
\end{align*}
\]

Then, \((X, A, U)\) is a complete generalized \(C^*\)-algebra-valued metric space.

Consider \(T_i : X^3 \to X\) and \(g : X \to X\) as

\[
T_i(t^1, t^2, t^3) = \frac{t^1 + t^2 + t^3}{3},
\]

\[g(t^1) = 9t^1.
\]

Choose

\[
\begin{align*}
\mathcal{A} &= \begin{pmatrix} \frac{1}{3} & 0 \\
0 & \frac{1}{3} \end{pmatrix}, \\
\mathcal{B} &= \begin{pmatrix} 0 & \frac{1}{3} \\
\frac{1}{3} & 0 \end{pmatrix}.
\end{align*}
\]

By induction, (3) holds for all \(t^1, t^2, t^3 \in X\). Set \(x = (t^1 + t^2 + t^3)/3\) and \(u = (u^1 + u^2 + u^3)/3\). Here, for \(i = 1\), we have

\[
\begin{align*}
\alpha &\leq \begin{pmatrix} |x - u| & 0 \\
0 & |x - u| \end{pmatrix} + \begin{pmatrix} 0 & \frac{1}{3} \\
\frac{1}{3} & 0 \end{pmatrix} \begin{pmatrix} 2 \frac{|x|}{3} & 0 \\
0 & \frac{1}{3} \end{pmatrix} \leq \begin{pmatrix} \frac{1}{3} & 0 \\
0 & \frac{1}{3} \end{pmatrix}
\end{align*}
\]

Also,

\[
\alpha \leq \begin{pmatrix} |x - u| & 0 \\
0 & |x - u| \end{pmatrix} + \begin{pmatrix} 0 & \frac{1}{3} \\
\frac{1}{3} & 0 \end{pmatrix} \begin{pmatrix} 2 \frac{|x|}{3} & 0 \\
0 & \frac{1}{3} \end{pmatrix} \leq \begin{pmatrix} \frac{1}{3} & 0 \\
0 & \frac{1}{3} \end{pmatrix}
\]

Clearly, \(g\) and \(\{T_i\}_{i \in \mathbb{N}}\) are \(u\)-compatible. Therefore, all conditions in Theorem 5 hold, and \((0, 0, 0)\) is the unique tripled common fixed point of \(g\) and \(\{T_i\}_{i \in \mathbb{N}}\).

**3. Application**

Consider the following sequence of the integral equations:

\[
x(t) = \int_t^U \left( T_1(y, t, s) + T_2(y, t, s)(f(y(t, s, x(s))) + g(T, s, x(s))) + h(t, s, x(s)) \right) ds + h(t),
\]

\[
\text{with initial conditions for } x(t) = \text{ given.}
\]

\[
\text{with initial conditions for } x(t) = \text{ given.}
\]
for all \( r, t, s \in E \), where \( E \) is a Lebesgue measurable set and \( m(E) < \infty \).

Denote by \( X = L^0(E) \) the set of essentially bounded measurable functions on \( E \). We consider the following assumptions:

(i) \( f_i, g_i, h_i : E \times E \times R \to R \), \( \gamma_1 : E \times E \times E \to 0, \infty \), \( \gamma_2 : E \times E \times E \to -\infty, 0 \) are integrable, and \( h \in L^0(E) \).

(ii) There is \( k \in (0, 1/2) \) so that for all \( t_1, t_2 \in R \)

\[
\begin{align*}
0 & \leq |f_i(t, s, \ell_1(s)) - f_i(t, s, \ell_2(s))| \leq k(\ell_1 - \ell_2), \\
-k(\ell_1 - \ell_2) & \leq |g_i(t, s, \ell_1(s)) - g_i(t, s, \ell_2(s))| \leq 0, \\
0 & \leq |h_i(t, s, \ell_1(s)) - h_i(t, s, \ell_2(s))| \leq k(\ell_1 - \ell_2),
\end{align*}
\]

for all \( s, t \in E \) with

\[
\begin{pmatrix}
1/9 & 0 \\
0 & 1/9
\end{pmatrix}
\]

(k \leq \rho^2)

\[
\begin{pmatrix}
0 & 1/9 \\
1/9 & 0
\end{pmatrix}
\]

(k \leq \beta^2)

\[
\begin{pmatrix}
1/9 & 0 \\
0 & 1/9
\end{pmatrix}
\]

(iii) \( \sup_{s,t \in E} \int_E (\gamma_1(r, s, t) - \gamma_2(r, s, t)) ds \leq 1 \)

**Theorem 7.** Suppose that assumptions (i)-(iii) hold. Then, (30) has a unique solution in \( L^0(E) \).

**Proof.** Let \( X = L^0(E) \) and \( B(L^2(E)) \) be the set of bounded linear operators on the Hilbert space \( L^2(E) \). We endow \( X \) with the cone metric \( \mathcal{U} : X \times X \to B(L^2(E)) \) defined by \( \mathcal{U}(f, g) = M_{(f,g)} \), where \( M_{(f,g)} \) is the multiplication operator on \( L^2(E) \). It is clear that \( (X, B(L^2(E)), \mathcal{U}) \) is a complete \( C^* \)-algebra-valued metric space. Define the self-mapping \( T_j : X^3 \to X \) by

\[
T_j(t_1, t_2, t_3)(t) = T_j(t_1, t_2, t_3, t) = \int_E (\gamma_1(r, s, t) + \gamma_2(r, s, t))
\]

\[
\cdot (f_i(t, s, \ell_1(s)) + g_i(t, s, \ell_2(s)) + h_i(t, s, \ell_3(s))) ds + h(t),
\]

for all \( t_1, t_2, t_3 \in X \) and \( r, s, t \in E \).

Now, we have

\[
\mathcal{U}(T_j(t_1, t_2, t_3, t_1, t_2, t_3)) = M_{|T_j(t_1, t_2, t_3, t_1, t_2, t_3)|}.
\]

Using (31), we have

\[
|T_j(t_1, t_2, t_3)(t) - T_j(t_1, t_2, t_3, t)| = \int_E \left| \gamma_1(r, s, t) + \gamma_2(r, s, t) \right|
\]

\[
\cdot (f_i(t, s, \ell_1(s)) + g_i(t, s, \ell_2(s)) + h_i(t, s, \ell_3(s))) ds + h(t),
\]

for all \( r, t, s \in E \).

Therefore, for any \( \varphi \in L^2(E) \), we have

\[
\|
\begin{pmatrix}
T_j(t_1, t_2, t_3) - T_j(t_1, t_2, t_3) \\
\varphi(t) \varphi(t)
\end{pmatrix}
\|
\leq \sup_{|\varphi| = 1} \left| \int_E \left| \gamma_1(r, s, t) + \gamma_2(r, s, t) \right|
\]

\[
\cdot (f_i(t, s, \ell_1(s)) + g_i(t, s, \ell_2(s)) + h_i(t, s, \ell_3(s))) ds + h(t),
\]

\[
\leq \left( k \left( \|t_1 - t_3\|_{\infty} + \|t_2 - t_3\|_{\infty} + \|t_3 - t_3\|_{\infty} \right) \right)
\]

for all \( r, t, s \in E \).

Consequently,

\[
\mathcal{U}(T_j(t_1, t_2, t_3, t_1, t_2, t_3)) \leq \rho \mathcal{U}(t_1, t_2, t_3) + \mathcal{U}(t_1, t_2, t_3) \mathcal{A}^{*} + \mathcal{B} \mathcal{U}(t_1, t_2, t_3) \mathcal{B}^{*}.
\]
