One of the main purposes of mathematical physics is to determine the exact solutions. Some scholars had perused the plenty of physical wave equations. Therefore, several analytical methods were systematically developed and applied to achieve exact and approximate solutions of fractional ordinary and partial differential equations with applications in various fields of sciences like fluid flow, mechanics, biology, nonlinear optics, substance energy, system identification, and geoptical filaments which are expressed in fractional forms [1–11].

In the past few decades, a lot of studies have been executed to find the new and further exact traveling wave solutions of space-time fractional PDEs by many research. With the collaboration of potential symbolic computer programming software, they have been appointed for researching appropriate solution to the nonlinear space-time fractional PDEs by executing powerful techniques, for example, the tan-ϕ/2 expansion method, the sin-Gordon expansion method, the G'/G expansion method, and the advanced exponential expansion method [12–25].

This work mainly investigates three nonlinear fractional models by utilizing the oncoming exp (−Θ(q)) expansion method [17, 25]. Recently, Bashar and Roshid [17] and Rahelman et al. [25] have studied this technique to some fractional and nonfractional NLEEs. They found that this introduced method provides some simple general form of traveling wave solutions. Rahelman et al. [25] did not give...
any fruitful discussion about fractional NLEEs with this proposed method. The important idea of this method is too explicit: the exact solutions of NLEEs satisfy the nonlinear ODE, $\Theta(q) + \theta \exp (\Theta(q)) + \delta \exp (-\Theta(q))$, where $\theta$ and $\delta$ are real parameters.

The space-time fractional Boussinesq equation with the $\rho$-derivative [26, 27] is presented as follows:

$$D_t^{2\alpha} \Psi + b D_x^{2\alpha} \Psi + \beta D_x^{2\alpha} (\Psi^2) + \gamma D_x^{2\alpha} \Psi = 0,$$  \hspace{1cm} t > 0, 0 < \alpha \leq 1,$$  \hspace{1cm} (1)$$

where $\Psi(x, t)$ is the vertical deflection. In Ref. [28], authors constructed an analytical solution for both linear and nonlinear time-fractional Boussinesq equations by an iterative method. Also, Hemeda [29] studied the fractional Boussinesq-like equation via a new iterative method. Authors of [30] investigated nonlinear two-point boundary value problem to the fractional Boussinesq-like equation. Furthermore, the space-time fractional breaking soliton equations [27, 31] are taken in the following form:

$$D_t^{2\alpha} \Psi + a D_x^{2\alpha} \Psi + 4a \Psi D_t^{\alpha} \Omega + 4a \Omega (D_x^{2\alpha} \Psi) = 0, \hspace{1cm} t > 0, 0 < \alpha \leq 1,$$

$$D_t^{\alpha} \Psi - D_x^{\alpha} \Omega = 0.$$  \hspace{1cm} (2)$$

Meng and Feng [32] used an auxiliary equation method to the space-time fractional (2 + 1)-dimensional breaking soliton equation. Authors of [27, 33, 34] discussed the space-time fractional SRLW equation (STFSRLWE) in the following case:

$$D_t^{2\alpha} \Psi + D_x^{2\alpha} \Psi + \Psi D_t^{\alpha} (D_x^{\alpha} \Psi) + D_t^{\alpha} \Psi D_x^{\alpha} \Psi + D_t^{2\alpha} (D_x^{2\alpha} \Psi) = 0, \hspace{1cm} t > 0, 0 < \alpha \leq 1,$$  \hspace{1cm} (3)$$

The functional variable method, exp-function method, and $(G'/G)$-expansion method to the fractional SRLW equation in the sense of the modified Riemann–Liouville derivative were utilized in Ref. [35]. The interested readers can see more works in Refs. (36–50)). Inc and coworkers presented the new soliton structures to some time-fractional nonlinear differential equations with a conformable derivative via the Ricatti–Bernoulli sub-ODE method [51]. Sahalshour and colleagues worked on the truncated $M$-fractional derivative as a novel and effective derivative under interval uncertainty and investigated the existence and uniqueness conditions of the solution [52]. Authors of [53] studied a coupled nonlinear Maccari’s system which describes the motion of isolated waves localized in a small part of space. Authors of [54] employed the exponential function method for the combined KdV-mKdV equation.

One technique, videlicet, the oncoming exp ($-\Theta(q)$) -expansion technique, was employed by many researchers for solving the number of nonlinear PDEs or fractional PDEs. For both methods, the interested readers can refer for the first technique to Refs. (55–59)).

The pattern of this article is summarized as follows. In Sections 2 and 3, the properties and the detail of technique are given, which are to be utilized for getting the exact solutions of the fractional Boussinesq, breaking soliton, and SRLW equations along with numerical simulation and details of graph in Sections 4–7. Finally, some conclusions are given in the end.

2. Analysis of $\mu$-Derivative

Definition 1 (see [60]). Definition of $\mu$-derivative: let $\lambda : [0; 1] \rightarrow \mathbb{R}$; then, the $\mu$-derivative of $\lambda$ of order $\mu$ is defined as

$$D_{t}^{\mu} \lambda(t) = \lim_{\varepsilon \rightarrow 0} \frac{\lambda(t + \varepsilon(t + (1/\Gamma(\mu))))^{1-\mu} - \lambda(t)}{\varepsilon}, \hspace{1cm} \mu \in (0, 1], t > 0.$$  \hspace{1cm} (4)$$

The features and novel theorems will be utilized as follows. The proofs of the above $\mu$-derivative properties are obviously given in [60].

Theorem 2. Let $\mu \in (0, 1]$; $\lambda, \delta$ be $\mu$-differentiable at point $t$; therefore, we get

(1) $D_{t}^{\mu} (a \lambda(t) + b \delta(t)) = a D_{t}^{\mu} (\lambda(t)) + b D_{t}^{\mu} (\delta(t))$, for $a, b \in \mathbb{R}$

(2) $D_{t}^{\mu} (c) = 0$, for $c \in \mathbb{R}$

(3) $D_{t}^{\mu} (\lambda(t) \delta(t)) = \lambda(t) D_{t}^{\mu} (\delta(t)) + \delta(t) D_{t}^{\mu} (\lambda(t))$

(4) $D_{t}^{\mu} (\lambda(t)) \delta(t) = \lambda(t)D_{t}^{\mu} (\delta(t)) - \delta(t)D_{t}^{\mu} (\lambda(t))/\delta(t)$

(5) $D_{t}^{\mu} \lambda(t) = (t + (1/\Gamma(\mu)))^{1-\mu} \lambda(t)/dt$

We have the following features as follows:

$$D_{t}^{\mu} \sin (t) = \lim_{\varepsilon \rightarrow 0} \frac{\sin [t + \varepsilon(t + (1/\Gamma(\mu)))^{1-\mu}] - \sin (t)}{\varepsilon} = \left( t + \frac{1}{\Gamma(\mu)} \right)^{1-\mu} \sin (t),$$

$$D_{t}^{\mu} \cos (t) = \lim_{\varepsilon \rightarrow 0} \frac{\cos [t + \varepsilon(t + (1/\Gamma(\mu)))^{1-\mu}] - \cos (t)}{\varepsilon} = \left( t + \frac{1}{\Gamma(\mu)} \right)^{1-\mu} \cos (t),$$

$$D_{t}^{\mu} \exp (t) = \lim_{\varepsilon \rightarrow 0} \frac{\exp [t + \varepsilon(t + (1/\Gamma(\mu)))^{1-\mu}] - \exp (t)}{\varepsilon} = \left( t + \frac{1}{\Gamma(\mu)} \right)^{1-\mu} \exp (t).$$  \hspace{1cm} (5)$$

Theorem 3. Let $\lambda : [0; 1] \rightarrow \mathbb{R}$; be a function such that $\lambda$ is differentiable and also $\mu$-differentiable. Also, let $\lambda$ be a
differentiable function defined in the range of $\theta$. Then, we get

$$D^r_\mu (\lambda \theta)(t) = \left( t + \frac{1}{I(\mu)} \right)^{\frac{j}{\mu}} \theta'(t) \lambda' (\theta(t)), \quad (6)$$

where prime denotes the classical derivatives with respect to $t$.

3. The Oncoming $\exp (-\Theta(q))$-Expansion Technique

This method was summarized and improved for achieving the analytic solutions of NLPDEs.

**Step 1.** Assume that a nonlinear partial differential equation is given in the general form as follows:

$$F(u, u_x, u_y, u_{xy}, u_{xt}, \cdots) = 0. \quad (7)$$

After simple algebraic operations, this equation is transformed into an ordinary differential equation (ODE) with the below transformation:

$$u(x, y, t) = U(q), q = x + ky + \omega t, \quad (8)$$

as well as into nonlinear ODE:

$$\delta \left( U, U', \omega U', kU', U''', \omega^2 U''', \cdots \right) = 0. \quad (9)$$

**Step 2.** Then, assume that the searched wave solutions of equation (9) have the following representation:

$$U(q) = \sum_{j=0}^{\chi} \pi_j Y^j(q), \quad \text{where } V_q = \Theta, \quad (10)$$

where $\pi_j (0 \leq j \leq \chi), \tau_j (0 \leq j \leq \chi)$ are constants to be determined, such that $\pi_j, \tau_j \neq 0$, and $\Theta = \Theta(q)$ is the solution of the following first-order differential equation:

$$\Theta' = \delta Y^{-1} \Theta + Y(q) + \theta. \quad (11)$$

If we try to find the solution of (11), then we obtain special solutions that vary according to the state of the coefficients:

**Solution 1** (hyperbolic function solution). If $\delta \neq 0$ and $\theta^2 - 4\delta < 0$, afterward we achieve

$$\Theta(q) = \ln \left( \frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) - \frac{\theta}{2\delta} \right) \right), \quad (12)$$

where $\Sigma$ is the integral constant.

**Solution 2** (trigonometric function solution). If $\delta \neq 0$ and $\theta^2 - 4\delta < 0$, afterward we achieve

$$\Theta(q) = \ln \left( \frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) - \frac{\theta}{2\delta} \right) \right), \quad (13)$$

**Solution 3.** If $\delta = 0, \theta \neq 0$, and $\theta^2 - 4\delta > 0$, afterward we achieve

$$\Theta(q) = -\ln \left( \frac{\theta}{\exp (\theta(q + \Sigma)) - 1} \right), \quad (14)$$

**Solution 4.** If $\delta \neq 0, \theta \neq 0$, and $\theta^2 - 4\delta = 0$, afterward we achieve

$$\Theta(q) = \ln \left( \frac{-2\theta(q + \Sigma) + 4}{\theta^2(q + \Sigma)} \right). \quad (15)$$

**Solution 5.** If $\delta = 0, \theta = 0$, and $\theta^2 - 4\delta = 0$, afterward we achieve

$$\Theta(q) = \ln (q + \Sigma), \quad (16)$$

where $\pi_j (0 \leq j \leq \chi), \tau_j (0 \leq j \leq \chi), \theta$, and $\delta$ are also the constants to be explored later. As usual, for determining $\chi$, the highest-order derivative should be balanced with the highest-order nonlinear terms in equation (10). However, the positive integer $\chi$ can be determined in this way.

**Step 3.** Following these operations, according to the $m$ value obtained above, let (11) be substituted into equation (10). Therefore, we obtain a set of algebraic equations that contains $Y^m(q)$ ($s = 0, 1, 2, \cdots$). Then, setting each coefficient of $\exp (-\Theta(q))s$ to zero, we can get a set of overdetermined equations for $\pi_0, \pi_1, \cdots, \pi_\chi, \tau_\chi, \theta$, and $\delta$. Since the obtained algebraic equation system will be difficult to solve manually, symbolic computation such as Maple can be used at this stage. Assume that the estimation of the constants can be gotten by fathoming the mathematical conditions in step 2. Substituting the estimations of the constants together with the arrangements of equation (11), we will acquire new and far reaching precise traveling wave arrangements of the nonlinear development equation (7).

The $\Sigma$ has the following features as follows:

$$U(q) = \xi y^\chi, \quad U'(q) = \xi y^{\chi - 1} Y' = \xi y^{\chi + 1}, \quad U''(q) = \xi y^{2\chi}, \quad (17)$$

$$\Theta(q) = \ln \left( \frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) - \frac{\theta}{2\delta} \right) \right), \quad (18)$$

where $\Sigma$ is the integral constant.
where $\xi = \pi_x$. Balancing $U''$ with $U^2$ yields

$$
\chi + 2 = 2\chi \Rightarrow \chi = 2.
$$

(18)

4. The First Equation

By utilizing the following transformation:

$$
q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu,
$$

(19)

then, equation (1) transformed to

$$
\omega^2\Psi'' + bk^2\Psi'' + \beta k^2 (\Psi^2)'' + y \Psi^{(4)} = 0,
$$

(20)

First:

$$
\omega = k \sqrt{y k^2 \theta^2 - 4\beta y k^2 - b, \pi_0} \\
= - \frac{k^2 y (\theta^2 + 2\delta)}{\beta}, \tau_1 \\
= - \frac{k^2 y}{\beta}, \tau_2 = - \frac{k^2 y}{\beta}.
$$

(24)

According to Family I, (22) becomes

$$
\Psi_1(q) = - \frac{k^2 y (\theta^2 + 2\delta)}{\beta} - \frac{6 (k^2 y \theta/\beta)}{\left( -\sqrt{\theta^2 - 4\delta/2\delta} \right) \tanh \left( \left( \sqrt{\theta^2 - 4\delta/2\delta} \right) (q + \Sigma) - (\theta/2\delta) \right)} \\
- \frac{6 (k^2 y \theta/\beta)}{\left( -\sqrt{\theta^2 - 4\delta/2\delta} \right) \tanh \left( \left( \sqrt{\theta^2 - 4\delta/2\delta} \right) (q + \Sigma) - (\theta/2\delta) \right)^2},
$$

(25)

where $\Psi' = d\Psi/dq$, and by integrating equation (20) twice with respect to $q$, it can be seen as

$$
(\omega^2 + bk^2)\Psi + \beta k^2 \Psi^2 + y \Psi^{(4)} = 0.
$$

(21)

The balance number will be obtained $\chi = 2$ by using the balance principle. Then, the exact solution is given as

$$
\Psi(q) = \pi_0 + \pi_1 Y(q) + \pi_2 Y^2(q) + \frac{\tau_1}{Y(q)} + \frac{\tau_2}{Y^2(q)}.
$$

(22)

Firstly, we substitute the expressions of $\Psi(q)$ in (22) into (21) and collect all terms with the same order of $Y(q)$. Then, by equating the coefficient of each polynomial to zero, we obtain a set of algebraic equations as follows:

$$
\begin{align*}
6 y k^4 \tau_2 + \beta k^2 \tau_2^2 &= 0, \\
10 y k^4 \theta t_2 + 2 y k^4 \tau_2 + 2 \beta k^2 \tau_2 t_2 &= 0, \\
4 y k^4 \theta t_2 + 8 \delta y k^4 \tau_2 + 3 y k^4 \theta t_1 + 2 \beta k^2 \tau_2 t_2 + \beta k^2 \tau_2^2 + \beta k^2 \tau_2 &= 0, \\
6 \delta y k^4 \theta t_2 + \gamma k^4 \theta t_1 + 2 \delta y k^4 \theta t_1 + 2 \beta k^2 \tau_2 t_2 + \beta k^2 \tau_2^2 + \omega^2 \tau_2 &= 0, \\
2 \delta y k^4 \theta t_2 + \delta \gamma k^4 \theta t_1 + \gamma k^4 \theta t_1 + 2 \gamma y k^4 \tau_2 + \beta k^2 \tau_2^2 + 2 \beta k^2 \tau_2 t_2 + \beta k^2 \tau_2 &= 0, \\
\gamma k^4 \theta t_1 + 2 \delta y k^4 \tau_2 + 2 \beta k^2 \tau_2 \tau_2 + \beta k^2 \tau_2 = 0, \\
3 \delta y k^4 \theta t_1 + 4 \delta y k^4 \tau_2 + 8 \delta y k^4 \tau_2 + 2 \beta k^2 \tau_2 \tau_2 + \beta k^2 \tau_2^2 + \omega^2 \tau_2 &= 0, \\
2 \delta y k^4 \tau_1 + 10 \delta y k^4 \theta t_2 + 2 \beta k^2 \tau_2 \tau_2 = 0, \\
6 \delta y k^4 \tau_2 + \beta k^2 \tau_2^2 &= 0.
\end{align*}
$$

(23)

where

$$
q = \frac{k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu}{-k \sqrt{y k^2 \theta^2 - 4\beta y k^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu}.
$$

(26)

According to Family II, (22) becomes

$$
\Psi_2(q) = - \frac{k^2 y (\theta^2 + 2\delta)}{\beta} - \frac{6 (k^2 y \theta/\beta)}{\left( -\sqrt{\theta^2 - 4\delta/2\delta} \right) \tanh \left( \left( \sqrt{\theta^2 - 4\delta/2\delta} \right) (q + \Sigma) - (\theta/2\delta) \right)} \\
- \frac{6 (k^2 y \theta/\beta)}{\left( -\sqrt{\theta^2 - 4\delta/2\delta} \right) \tanh \left( \left( \sqrt{\theta^2 - 4\delta/2\delta} \right) (q + \Sigma) - (\theta/2\delta) \right)^2},
$$

(27)
where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{\gamma k^2 \theta^2 - 4\delta y k^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \] \( \tag{28} \)

According to Family III, (22) can be written as
\[ \Psi_3(q) = -\frac{k^2 y \theta^2}{\beta} - 6 \frac{k^2 y \theta}{\beta} \left( \frac{\theta}{\exp(\theta(q + \Sigma)) - 1} \right)^2 \] \( \tag{29} \)
where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{y k^2 \theta^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \] \( \tag{30} \)

According to Family IV, (22) becomes
\[ \Psi_4(q) = -\frac{k^2 y (\theta^2 + 2\delta)}{\beta} - 6 \frac{k^2 y \theta}{\beta} \left( \frac{\theta^2 (q + E)}{2\theta(q + \Sigma) + 4} \right)^2 \] \( \tag{31} \)
where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{-b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \] \( \tag{32} \)

Second:
\[ \omega = k \sqrt{-\gamma k^2 \theta^2 + 4\delta y k^2 - b}, \pi_0 = -6k^2 y \delta, \tau_1 = -6k^2 y \theta, \tau_2 = -6k^2. \] \( \tag{33} \)

According to Family I, (22) can be written as
\[ \Psi_1(q) = -6k^2 y \delta \] \( \tag{34} \)

where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{-\gamma k^2 \theta^2 + 4\delta y k^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \] \( \tag{35} \)

According to Family II, (22) can be written as
\[ \Psi_2(q) = -\frac{6k^2 y \delta}{\beta} \left( \frac{\theta}{\exp(\theta(q + \Sigma)) - 1} \right)^2 \] \( \tag{36} \)
where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{-\gamma k^2 \theta^2 + 4\delta y k^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \] \( \tag{37} \)

According to Family III, (22) can be written as
\[ \Psi_3(q) = -\frac{6k^2 y \delta}{\beta} \left( \frac{\theta}{\exp(\theta(q + \Sigma)) - 1} \right)^2 \] \( \tag{38} \)
where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{-\gamma k^2 \theta^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \] \( \tag{39} \)

According to Family IV, (22) becomes
\[ \Psi_4(q) = -\frac{6k^2 y \delta}{\beta} \left( \frac{\theta}{\exp(\theta(q + \Sigma)) - 1} \right)^2 \] \( \tag{40} \)
where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{-\gamma k^2 \theta^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \] \( \tag{41} \)

Third:
\[ \omega = k \sqrt{\gamma k^2 \theta^2 + 4\delta y k^2 - b}, \pi_0 = \frac{k^2 y (\theta^2 + 2\delta)}{\beta}, \tau_1 = -6k^2 y \theta, \tau_2 = -6k^2. \] \( \tag{42} \)
According to Family I, (22) becomes

\[
\mathcal{F}_\alpha(q) = -\frac{k^2 q^2 (\theta^2 + 2 \delta)}{\beta} - \frac{6k^2 q \theta}{\beta} 
\times \left( -\frac{\sqrt{\theta^2 - 4 \delta}}{2} \tanh \left( \frac{\sqrt{\theta^2 - 4 \delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2 \delta} \right) 
\times \left( -\frac{\sqrt{\theta^2 - 4 \delta}}{2} \tanh \left( \frac{\sqrt{\theta^2 - 4 \delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2 \delta} \right)^2, 
\]

where

\[
q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k\sqrt{b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. 
\]

According to Family II, (22) can be written as

\[
\mathcal{F}_{1a}(q) = -\frac{k^2 q^2 (\theta^2 + 2 \delta)}{\beta} - \frac{6k^2 q \theta}{\beta} 
\times \left( \frac{\sqrt{-\theta^2 + 4 \delta}}{2} \tan \left( \frac{\sqrt{-\theta^2 + 4 \delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2 \delta} \right) 
\times \left( \frac{\sqrt{-\theta^2 + 4 \delta}}{2} \tan \left( \frac{\sqrt{-\theta^2 + 4 \delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2 \delta} \right)^2, 
\]

where

\[
q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k\sqrt{\gamma k^2 \theta^2 - 4 \delta \gamma k^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. 
\]

According to Family III, (22) can be written as

\[
\mathcal{F}_{11}(q) = -\frac{k^2 q^2 (\theta^2 + 2 \delta)}{\beta} - \frac{6k^2 q \theta}{\beta} 
\times \left( \frac{\sqrt{-\theta^2 + 4 \delta}}{2} \tan \left( \frac{\sqrt{-\theta^2 + 4 \delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2 \delta} \right) 
\times \left( \frac{\sqrt{-\theta^2 + 4 \delta}}{2} \tan \left( \frac{\sqrt{-\theta^2 + 4 \delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2 \delta} \right)^2, 
\]

where

\[
q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k\sqrt{\gamma k^2 \theta^2 - 4 \delta \gamma k^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. 
\]

According to Family IV, (22) can be written as

\[
\mathcal{F}_{12}(q) = -\frac{k^2 q^2 (\theta^2 + 2 \delta)}{\beta} - \frac{6k^2 q \theta}{\beta} 
\times \left( -\frac{2 \theta (q + \Sigma) + 4}{\theta^2 (q + E)} \right) 
\times \left( -\frac{2 \theta (q + \Sigma) + 4}{\theta^2 (q + E)} \right)^2, 
\]

where

\[
q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k\sqrt{\gamma k^2 \theta^2 - 4 \delta \gamma k^2 - b} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. 
\]
where

\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{-y k^2 \theta^2 - b} \left( t + \frac{1}{\Gamma(\alpha)} \right)^\alpha. \]  

(57)

According to Family IV, (22) can be written as

\[ \Psi_{16}(q) = -\frac{6 k^2 \gamma \delta}{\beta} - \frac{6 k^2 \gamma \theta}{\beta} \left( -\frac{2 \theta (q + \Sigma) + 4}{2 \theta^2 (q + E)} \right) \]

\[ - \frac{6 k^2 \gamma}{\beta} \left( -\frac{2 \theta (q + E) + 4}{2 \theta^2 (q + \Sigma)} \right)^2, \]

where

\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - k \sqrt{-y} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  

(59)

Fifth:

\[ k = \frac{1}{6} \frac{\sqrt{-6 y \beta \pi_2}}{\delta \gamma}, \]

\[ \omega = \frac{1}{2} \frac{\sqrt{2 \delta \gamma \beta \pi_2 (3 \delta^2 + 8 \beta \pi_2)}}{\delta \gamma}, \]

\[ \pi_0 = \frac{2 \pi_2}{\delta}, \pi_2 = \frac{\pi_2}{\delta}. \]

According to Family I, (22) becomes

\[ \Psi_{17}(q) = \frac{2 \pi_2}{\delta} - \pi_2 \frac{\delta}{\sqrt{\delta}} \coth^2 \left( \frac{\sqrt{-4 \delta}}{2} (q + \Sigma) \right) \]

\[ - \frac{\pi_2 \sqrt{-\delta}}{\delta \gamma} \tanh^2 \left( \frac{\sqrt{-4 \delta}}{2} (q + \Sigma) \right), \]

where

\[ q = \frac{1}{6} \frac{\sqrt{-6 y \beta \pi_2}}{\delta \gamma} \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu \]

\[ - \frac{1}{6} \frac{\sqrt{2 \delta \gamma \beta \pi_2 (3 \delta^2 + 8 \beta \pi_2)}}{\delta \gamma} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  

(62)

According to Family II, (22) becomes

\[ \Psi_{18}(q) = \frac{2 \pi_2}{\delta} + \pi_2 \frac{2 \delta}{\sqrt{4 \delta}} \cot^2 \left( \frac{\sqrt{4 \delta}}{2} (q + \Sigma) \right) \]

\[ + \frac{\pi_2 \sqrt{4 \delta}}{\delta^2} \tan^2 \left( \frac{\sqrt{4 \delta}}{2} (q + \Sigma) \right), \]

where

\[ q = \frac{1}{6} \frac{\sqrt{-6 y \beta \pi_2}}{\delta \gamma} \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu \]

\[ - \frac{1}{6} \frac{\sqrt{2 \delta \gamma \beta \pi_2 (3 \delta^2 + 8 \beta \pi_2)}}{\delta \gamma} \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  

(64)

5. The Second Equation

By utilizing the following transformation:

\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu + c \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu - \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu, \]  

(65)

then, equation (1) transformed to

\[ -c\Psi' + ak^2 \omega \Psi''' + 4ak\Psi\Omega' + 4ak\Psi'^2 \Omega = 0, \]

\[ \omega \Psi' - k \Omega' = 0, \]

where \( \Psi' = d\Psi/dq \) and \( \Omega' = d\Omega/dq \). By putting \( \Omega = (\omega/k)\Psi \) into equation (66), it can be seen as

\[ -c\Psi' + ak^2 \omega \Psi''' + 8a \omega \Psi' - 8a \omega \Psi' = 0. \]

(68)

The balance number will be obtained \( \chi = 2 \) by using the balance principle. Then, the exact solution is given as

\[ \Psi(q) = \pi_0 + \pi_1 Y(q) + \pi_2 Y^2(q) + \frac{\tau_1}{Y(q)} + \frac{\tau_2}{Y^2(q)}. \]  

(69)

Firstly, we substitute the expressions of \( \Psi(q) \) in (69) into (68) and collect all terms with the same order of \( Y(q) \). Then, by equating the coefficient of each polynomial to zero, we obtain a set of algebraic equations as follows:

\[
\begin{align*}
6a k^2 \omega \tau_1 + 4a \omega \tau_1^2 &= 0, \\
10a k^2 \omega \tau_1 + 2a k^2 \omega \tau_1 + 8a \omega \tau_1 &= 0, \\
4a k^2 \omega \omega \tau_1 + 8a k^2 \omega \omega \tau_1 + 8a \omega \omega \tau_1 + 4a \omega \omega \tau_1 - c \tau_1 &= 0, \\
6a k^2 \omega \omega \tau_1 + ak^2 \omega \omega \tau_1 + 2a k^2 \omega \omega \tau_1 + 8a \omega \omega \tau_1 + 8a \omega \omega \tau_1 - c \tau_1 &= 0, \\
2a k^2 \omega \omega \tau_1 + ak^2 \omega \omega \tau_1 + ak^2 \omega \omega \tau_1 + 2a k^2 \omega \omega \tau_1 + 2a k^2 \omega \omega \tau_1 + 4a \omega \omega \tau_1 + 8a \omega \omega \tau_1 + 8a \omega \omega \tau_1 - c \tau_1 &= 0, \\
ak^2 \omega \omega \omega \tau_1 + 2a k^2 \omega \omega \omega \tau_1 + 6a k^2 \omega \omega \omega \tau_1 + 8a \omega \omega \omega \tau_1 + 8a \omega \omega \omega \tau_1 - c \tau_1 &= 0, \\
ak^2 \omega \omega \omega \tau_1 + 4a k^2 \omega \omega \omega \tau_1 + 6a k^2 \omega \omega \omega \tau_1 + 8a \omega \omega \omega \tau_1 + 4a \omega \omega \omega \tau_1 - c \tau_1 &= 0, \\
2a k^2 \omega \omega \omega \tau_1 + 10a k^2 \omega \omega \omega \tau_1 + 8a \omega \omega \omega \tau_1 &= 0, \\
6a k^2 \omega \omega \omega \tau_1 + 4a \omega \omega \omega \tau_1 &= 0.
\end{align*}
\]  

(70)

First:

\[
\begin{align*}
\frac{1}{2} k^2 \omega^2, \tau_1 &= \frac{3}{2} \theta, \tau_2 &= \frac{3}{2} \theta.
\end{align*}
\]  

(71)
According to Family I, (69) can be written as

\[
\Psi_1(q) = -\frac{1}{4}k^2\vartheta^2 - \frac{1}{2} \Delta k^2 \\
- \frac{(3/2) \theta k^2}{\left(-\left((\sqrt{\theta^2 - 4\delta/2}) \tan \left((\sqrt{\theta^2 - 4\delta/2}) (q + \Sigma) - (\theta/2\delta)\right)\right)} \\
- \frac{(3/2) k^2}{\left((-\left((\sqrt{\theta^2 - 4\delta/2}) \tan \left((\sqrt{\theta^2 - 4\delta/2}) (q + \Sigma) - (\theta/2\delta)\right)\right)}.
\]

where

\[
q = k\left(x + \frac{1}{\Gamma(\mu)}\right) - \left(ak^2\vartheta^2 - 4a\Delta k^2\right)\omega\left(y + \frac{1}{\Gamma(\mu)}\right) - \omega\left(t + \frac{1}{\Gamma(\mu)}\right).
\]

According to Family II, (69) becomes

\[
\Psi_2(q) = -\frac{1}{4}k^2\vartheta^2 - \frac{1}{2} \Delta k^2 \\
- \frac{(3/2) \theta k^2}{\left((\sqrt{\theta^2 - 4\delta/2}) \tan \left((\sqrt{\theta^2 - 4\delta/2}) (q + \Sigma) - (\theta/2\delta)\right)\right)} \\
- \frac{(3/2) k^2}{\left((-\left((\sqrt{\theta^2 - 4\delta/2}) \tan \left((\sqrt{\theta^2 - 4\delta/2}) (q + \Sigma) - (\theta/2\delta)\right)\right)}.
\]

where

\[
q = k\left(x + \frac{1}{\Gamma(\mu)}\right) - \left(ak^2\vartheta^2 - 4a\Delta k^2\right)\omega\left(y + \frac{1}{\Gamma(\mu)}\right) - \omega\left(t + \frac{1}{\Gamma(\mu)}\right).
\]

According to Family III, (69) becomes

\[
\Psi_3(q) = -\frac{1}{4}k^2\vartheta^2 - \frac{(3/2) \theta k^2}{\left((\exp (\theta(q + \Sigma)) - 1)/\theta\right)} \\
- \frac{(3/2) k^2}{\left((\exp (\theta(q + \Sigma)) - 1)/\theta\right)}.
\]

where

\[
q = k\left(x + \frac{1}{\Gamma(\mu)}\right) - \left(ak^2\vartheta^2 \omega\left(y + \frac{1}{\Gamma(\mu)}\right) - \omega\left(t + \frac{1}{\Gamma(\mu)}\right)\right).
\]

According to Family I, (69) can be seen as

\[
\Psi_4(q) = -\frac{3}{2} \delta k^2 \\
- \frac{(3/2) \theta k^2}{\left((-\left((\sqrt{\theta^2 - 4\delta/2}) \tan \left((\sqrt{\theta^2 - 4\delta/2}) (q + \Sigma) - (\theta/2\delta)\right)\right)} \\
- \frac{(3/2) k^2}{\left((-\left((\sqrt{\theta^2 - 4\delta/2}) \tan \left((\sqrt{\theta^2 - 4\delta/2}) (q + \Sigma) - (\theta/2\delta)\right)\right)}.
\]

where

\[
q = k\left(x + \frac{1}{\Gamma(\mu)}\right) - \left(-ak^2\vartheta^2 + 4a\Delta k^2\right)\omega\left(y + \frac{1}{\Gamma(\mu)}\right) - \omega\left(t + \frac{1}{\Gamma(\mu)}\right).
\]

According to Family II, (69) becomes

\[
\Psi_5(q) = -\frac{3}{2} \delta k^2 \\
- \frac{(3/2) \theta k^2}{\left((-\left((\sqrt{\theta^2 - 4\delta/2}) \tan \left((\sqrt{\theta^2 - 4\delta/2}) (q + \Sigma) - (\theta/2\delta)\right)\right)} \\
- \frac{(3/2) k^2}{\left((-\left((\sqrt{\theta^2 - 4\delta/2}) \tan \left((\sqrt{\theta^2 - 4\delta/2}) (q + \Sigma) - (\theta/2\delta)\right)\right)}.
\]

where

\[
q = k\left(x + \frac{1}{\Gamma(\mu)}\right) - \left(-ak^2\vartheta^2 + 4a\Delta k^2\right)\omega\left(y + \frac{1}{\Gamma(\mu)}\right) - \omega\left(t + \frac{1}{\Gamma(\mu)}\right).
\]

According to Family III, (69) can be written as

\[
\Psi_6(q) = -\frac{(3/2) \theta k^2}{\left((\exp (\theta(q + \Sigma)) - 1)/\theta\right)} \\
- \frac{(3/2) k^2}{\left((\exp (\theta(q + \Sigma)) - 1)/\theta\right)}.
\]

where

\[
q = k\left(x + \frac{1}{\Gamma(\mu)}\right) + \left(ak^2\vartheta^2 \omega\left(y + \frac{1}{\Gamma(\mu)}\right) - \omega\left(t + \frac{1}{\Gamma(\mu)}\right)\right).
\]

Second:

\[
c = -\left(-ak^2\vartheta^2 + 4a\Delta k^2\right)\omega, \pi_0 = -\frac{3}{2} \delta k^2, \tau_1 = -\frac{3}{2} \theta k^2, \tau_2 = -\frac{3}{2} k^2.
\]

(78)
Third:
\[ c = -(a k^2 \theta^2 - 4a \delta k^2) \omega, \]  
\[ \pi_0 = -\frac{1}{4} k^2 \theta^2 - \frac{1}{2} \delta k^2, \]  
\[ \pi_2 = -\frac{3}{2} k^2. \]  
(85)

According to Family I, (69) becomes
\[ \Psi_7(q) = -\frac{1}{4} k^2 \theta^2 - \frac{1}{2} \delta k^2 + \frac{3}{2} \delta \theta^2 \left( -\frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \right) \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2\delta} \]  
\[ -\frac{3}{2} k^2 \left( -\frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \right) \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2\delta} \right)^2, \]  
(86)

where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - (a k^2 \theta^2 - 4a \delta k^2) \omega \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu \]  
\[ -\omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  
(87)

According to Family II, (69) can be written as
\[ \Psi_6(q) = -\frac{1}{4} k^2 \theta^2 - \frac{1}{2} \delta k^2 + \frac{3}{2} \delta \theta^2 \left( -\frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \right) \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2\delta} \]  
\[ -\frac{3}{2} k^2 \left( -\frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \right) \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2\delta} \right)^2, \]  
(88)

where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - (a k^2 \theta^2 - 4a \delta k^2) \omega \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu \]  
\[ -\omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  
(89)

According to Family III, (69) can be written as
\[ \Psi_5(q) = -\frac{1}{4} k^2 \theta^2 - \frac{(3/2) \delta k^2}{(\theta/(\exp(\theta(q + \Sigma))) - 1))}, \]  
\[ -\frac{(3/2) \delta k^2}{(\theta/(\exp(\theta(q + \Sigma))) - 1))}, \]  
(90)

where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - ak^2 \omega \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu + \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  
(91)

Fourth:
\[ c = -(a k^2 \theta^2 + 4a \delta k^2) \omega, \]  
\[ \pi_0 = -\frac{3}{2} \delta k^2, \pi_1 = \frac{3}{2} \delta k^2, \pi_2 = -\frac{3}{2} k^2. \]  
(92)

According to Family I, (69) can be seen as
\[ \Psi_{10}(q) = -\frac{3}{2} \delta k^2 - \frac{3}{2} \delta \theta^2 \cdot \left( -\frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \right) \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2\delta} \]  
\[ -\frac{3}{2} k^2 \left( -\frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \right) \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2\delta} \right)^2, \]  
(93)

where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - (a k^2 \theta^2 + 4a \delta k^2) \omega \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu \]  
\[ -\omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  
(94)

According to Family II, (69) can be written as
\[ \Psi_{11}(q) = -\frac{3}{2} \delta k^2 \left( -\frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \right) \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2\delta} \]  
\[ -\frac{3}{2} k^2 \left( -\frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \right) \tan \left( \frac{\sqrt{\theta^2 - 4\delta}}{2} (q + \Sigma) \right) - \frac{\theta}{2\delta} \right)^2, \]  
(95)

where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - (a k^2 \theta^2 + 4a \delta k^2) \omega \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu \]  
\[ -\omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  
(96)

According to Family III, (69) becomes
\[ \Psi_{12}(q) = -\frac{(3/2) \delta k^2}{(\theta/(\exp(\theta(q + \Sigma))) - 1))}, \]  
\[ -\frac{(3/2) \delta k^2}{(\theta/(\exp(\theta(q + \Sigma))) - 1))}, \]  
(97)

where
\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - ak^2 \omega \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu + \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  
(91)
where

\[ q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu + ak^2 \theta^2 \omega \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu - \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]  
(98)

Fifth:

\[ k = \frac{1}{4} \sqrt{-ab\omega}, \quad \tau_0 = \frac{3c}{16aomega}, \quad \tau_2 = \frac{3c}{32aomega}. \]  
(99)

According to Family I, (22) can be written as

\[
\Psi_{13}(q) = \frac{3}{16aomega} \frac{3c\delta}{32awa\sqrt{\delta}} \coth^2 \left( \frac{\sqrt{4\delta}}{2} (q + \Sigma) \right) - \frac{3c}{32aomega} \frac{\sqrt{\delta}}{\delta} \tanh^2 \left( \frac{\sqrt{4\delta}}{2} (q + \Sigma) \right),
\]

where

\[
q = \frac{1}{4} \sqrt{-ab\omega} \left( x + \frac{1}{\Gamma(\alpha)} \right)^\alpha - c \left( y + \frac{1}{\Gamma(\alpha)} \right)^\alpha - \omega \left( t + \frac{1}{\Gamma(\alpha)} \right)^\alpha.
\]
(101)

According to Family II, (22) becomes

\[
\Psi_{14}(q) = \frac{3}{16aomega} \frac{3c\delta}{32awa\sqrt{\delta}} \cot^2 \left( \frac{\sqrt{4\delta}}{2} (q + \Sigma) \right) + \frac{3c}{32aomega} \frac{\sqrt{\delta}}{\delta} \tan^2 \left( \frac{\sqrt{4\delta}}{2} (q + \Sigma) \right),
\]

where

\[
q = \frac{1}{4} \sqrt{-ab\omega} \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - c \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu - \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu.
\]
(103)

Sixth:

\[ k = \frac{1}{4} \sqrt{-ab\omega}, \quad \pi_0 = \frac{1}{16aomega}, \quad \pi_2 = -\frac{3c\delta}{32awa}, \quad \tau_2 = -\frac{3c}{32aomega}. \]  
(104)

According to Family I, (22) can be written as

\[
\Psi_{15}(q) = \frac{1}{16aomega} \frac{3c\delta}{32awa\sqrt{\delta}} \coth^2 \left( \frac{\sqrt{4\delta}}{2} (q + \Sigma) \right) + \frac{3c}{32aomega} \frac{\sqrt{\delta}}{\delta} \tanh^2 \left( \frac{\sqrt{4\delta}}{2} (q + \Sigma) \right),
\]

where

\[
q = \frac{1}{4} \sqrt{-ab\omega} \left( x + \frac{1}{\Gamma(\alpha)} \right)^\alpha - c \left( y + \frac{1}{\Gamma(\alpha)} \right)^\alpha - \omega \left( t + \frac{1}{\Gamma(\alpha)} \right)^\alpha.
\]
(106)

According to Family II, (22) can be seen as

\[
\Psi_{16}(q) = \frac{1}{16aomega} \frac{3c\delta}{32awa\sqrt{\delta}} \cot^2 \left( \frac{\sqrt{4\delta}}{2} (q + \Sigma) \right) - \frac{3c}{32aomega} \frac{\sqrt{\delta}}{\delta} \tan^2 \left( \frac{\sqrt{4\delta}}{2} (q + \Sigma) \right),
\]

where

\[
q = \frac{1}{4} \sqrt{-ab\omega} \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - c \left( y + \frac{1}{\Gamma(\mu)} \right)^\mu - \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu.
\]
(108)

6. The Third Equation

By utilizing the following transformation:

\[
\eta = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu - \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu,
\]
(109)

then, equation (1) transformed to

\[
2(\omega^2 + k^2) \Psi + k\omega \Psi^2 + 2k^2 \omega^2 \Psi'' = 0,
\]
(110)

where \( \Psi' = d\Psi/dq \), and by integrating equation (110) twice with respect to \( q \), it can be seen as

\[
(\omega^2 + bk^2) \Psi + bk^2 \Psi^2 + yk^4 \Psi'' = 0.
\]
(111)

The balance number will be obtained \( \chi = 2 \) by using the balance principle. Then, the exact solution is given as

\[
\Psi(q) = \pi_0 + \pi_1 Y(q) + \pi_2 Y^2(q) + \frac{\tau_1}{Y(q)} + \frac{\tau_2}{Y^2(q)}.
\]
(112)

Firstly, we substitute the expressions of \( \Psi(q) \) in (112) into (111) and collect all terms with the same order of \( Y(q) \). Then,
by equating the coefficient of each polynomial to zero, we obtain a set of algebraic equations as follows:

\[
\begin{align*}
12k^2 \omega^2 r_2 + k \omega r_2^2 &= 0, \\
20k^2 \omega^2 \theta r_2 + 4k^2 \omega^2 r_1 + 2k \omega r_1 r_2 &= 0, \\
8k^2 \omega \theta^2 r_2 + 16k^2 \omega^2 r_2 + 6k^2 \omega^2 \theta r_1 + 2k \omega \pi_0 r_2 + 2k \omega^2 r_2 + 2k^2 \omega^2 r_2 &= 0, \\
12k^2 \omega \theta^2 r_2 + 2k^2 \omega^2 \theta r_1 + 4k^2 \omega^2 r_1 + 2k \omega \pi_0 r_1 + 2k \omega^2 r_1 + 2k \omega r_1 + 2k^2 r_1 + 2 \omega^2 r_1 &= 0, \\
4k^2 \omega^2 r_2 + 2k^2 \omega^2 \theta r_1 + 4k^2 \omega^2 \pi_0 + 2k \omega \pi_0 r_1 + 2k \omega^2 \pi_1 + 2k \omega^2 r_1 + 2k^2 \pi_0 + 2 \omega^2 \pi_0 &= 0, \\
2k^2 \omega^2 \theta r_1 + 4k^2 \omega^2 r_1 + 12k^2 \omega^2 \theta r_1 + 2k \omega \pi_0 r_1 + 2k \omega^2 r_1 + 2k^2 \pi_1 + 2 \omega^2 \pi_1 &= 0, \\
6k^6 \omega^2 \pi_1 + 8k^2 \omega^2 \theta r_2 + 16k^2 \omega^2 \pi_1 + 2k \omega \pi_0 r_1 + 2k \omega^2 r_1 + 2k^2 \pi_1 + 2 \omega^2 \pi_1 &= 0, \\
4 \delta \omega^2 \pi_1 + 20k^2 \omega^2 \pi_1 + 2k \omega \pi_0 r_1 + 2k \omega^2 \pi_1 &= 0, \\
12k^2 \omega^2 \pi_1 + 2k \omega \pi_0 r_1 &= 0.
\end{align*}
\]

First:

\[
\begin{align*}
\delta &= \frac{3k^2 + \omega^2}{16 k \omega}, \theta = 0, \pi_0 = -\frac{3k^2 + \omega^2}{2k \omega}, r_2 = -12k \omega. \\
\end{align*}
\]  \hspace{1cm} (114)

According to Family I, (112) can be written as

\[
\begin{align*}
\Psi_1(q) &= -\frac{3k^2 + \omega^2}{k \omega} + \frac{3}{64k^3 \omega^3} \delta \coth^2 \left(\frac{\sqrt{-4\delta}}{2}(q + \Sigma)\right) \\
&+ \frac{12k \omega}{\delta} \tanh^2 \left(\frac{\sqrt{-4\delta}}{2}(q + \Sigma)\right),
\end{align*}
\]  \hspace{1cm} (115)

where

\[
q = k \left(x + \frac{1}{\Gamma(\alpha)}\right)^{\alpha} - \omega \left(t + \frac{1}{\Gamma(\alpha)}\right)^{\alpha}.
\]  \hspace{1cm} (116)

According to Family II, (112) becomes

\[
\begin{align*}
\Psi_2(q) &= -\frac{3k^2 + \omega^2}{k \omega} - \frac{3}{64k^3 \omega^3} \delta \cot^2 \left(\frac{\sqrt{4\delta}}{2}(q + \Sigma)\right) \\
&+ \frac{12k \omega}{\delta} \tan^2 \left(\frac{\sqrt{4\delta}}{2}(q + \Sigma)\right),
\end{align*}
\]  \hspace{1cm} (117)

where

\[
\delta = \frac{k^2 + \omega^2}{16 k \omega}, q = k \left(x + \frac{1}{\Gamma(\mu)}\right)^{\mu} - \omega \left(t + \frac{1}{\Gamma(\mu)}\right)^{\mu}.
\]  \hspace{1cm} (118)

Second:

\[
\begin{align*}
\delta &= \frac{-1}{16} \frac{k^2 + \omega^2}{k \omega} , \theta = 0, \pi_0 = -\frac{-1}{2} \frac{k^2 + \omega^2}{k \omega} , \\
\pi_2 &= -\frac{3k^2 + \omega^2}{64k^3 \omega^3}, r_2 = -12k \omega.
\end{align*}
\]  \hspace{1cm} (119)

According to Family I, (112) becomes

\[
\begin{align*}
\Psi_3(q) &= \frac{1}{2} \frac{k^2 + \omega^2}{k \omega} + \frac{3}{64k^3 \omega^3} \delta \coth^2 \left(\frac{\sqrt{-4\delta}}{2}(q + \Sigma)\right) \\
&+ \frac{12k \omega}{\delta} \tanh^2 \left(\frac{\sqrt{-4\delta}}{2}(q + \Sigma)\right),
\end{align*}
\]  \hspace{1cm} (120)

where

\[
q = k \left(x + \frac{1}{\Gamma(\alpha)}\right)^{\alpha} - \omega \left(t + \frac{1}{\Gamma(\alpha)}\right)^{\alpha}.
\]  \hspace{1cm} (121)

According to Family II, (112) can be written as

\[
\begin{align*}
\Psi_4(q) &= -\frac{1}{2} \frac{k^2 + \omega^2}{k \omega} - \frac{3}{64k^3 \omega^3} \delta \cot^2 \left(\frac{\sqrt{4\delta}}{2}(q + \Sigma)\right) \\
&+ \frac{12k \omega}{\delta} \tan^2 \left(\frac{\sqrt{4\delta}}{2}(q + \Sigma)\right),
\end{align*}
\]  \hspace{1cm} (122)
Figure 1: The different types of graphs to bright solution (25) for the parameters $\theta = 3, \delta = 2, k = -2, \gamma = 1, b = -10,$ and $\beta = 2$ with providing amounts of (a) $\mu = 0.5,$ (b) $\mu = 0.75,$ and (c) $\mu = 1$ within the interval $0 \leq x \leq 20, 0 \leq t \leq 10.$

Figure 2: The different types of graphs to periodic solution (27) for the parameters $\theta = 2, \delta = 3, k = -2, \gamma = -1, b = 1,$ and $\beta = 2$ with providing amounts of (a) $\mu = 0.5,$ (b) $\mu = 0.75,$ and (c) $\mu = 1$ within the interval $0 \leq x \leq 20, 0 \leq t \leq 10.$
\[ \delta = -\frac{1}{16} \frac{k^2 + \omega^2}{k^2 \omega^2} - q = k \left( x + \frac{1}{I(\mu)} \right)^\mu - \omega \left( t + \frac{1}{I(\mu)} \right)^\mu. \]

(123)

According to Family II, (112) can be seen as

\[ \Psi_s(q) = -3 \frac{k^2 \omega^2 \partial^2 + k^2 + \omega^2}{k \omega} \frac{3 \left( (k^2 \omega^2 \partial^2 + k^2 + \omega^2) \theta \omega \right)}{\left( \sqrt{\theta^2 + 4\delta} \right)^2} \tan \left( \left( \sqrt{\theta^2 + 4\delta} \right) (\pi + \frac{\omega}{2}) \right) - \left( \frac{\theta}{2\delta} \right)^2. \]

(125)

where

\[ \theta^2 - 4\delta = -\frac{k^2 + \omega^2}{k^2 \omega^2} < 0, q = k \left( x + \frac{1}{I(\mu)} \right)^\mu - \omega \left( t + \frac{1}{I(\mu)} \right)^\mu. \]

(126)

where

\[ \delta = \frac{1}{4} \frac{k^2 \omega^2 \theta^2 + k^2 + \omega^2}{k^2 \omega^3}, \]

\[ \theta = 0, \pi_0 = -\frac{3}{k \omega} \frac{k^2 \omega^2 \theta^2 + k^2 + \omega^2}{k \omega^2}, \]

\[ \pi_1 = -\frac{3}{k \omega} \frac{(k^2 \omega^2 \theta^2 + k^2 + \omega^2) \theta}{k \omega}, \]

\[ \pi_2 = -\frac{3}{k \omega} \frac{(k^2 \omega^2 \theta^2 + k^2 + \omega^2)^2}{k^2 \omega^3}. \]

(124)

Third:

\[ \delta = -\frac{1}{16} \frac{k^2 + \omega^2}{k^2 \omega^2} + \frac{1}{16} \frac{k^2 + \omega^2}{k^2 \omega^2}, \]

\[ q = k \left( x + \frac{1}{I(\mu)} \right)^\mu - \omega \left( t + \frac{1}{I(\mu)} \right)^\mu. \]

(123)
Fourth:

\[
\delta = \frac{1}{4} k^2 \omega^2 \theta^2 - k^2 - \omega^2, \quad \theta = 0, \quad \pi_0 = -\frac{3k^2 \omega^2 \theta^2 - k^2 - \omega^2}{k\omega}, \\
\pi_1 = -\frac{3}{4} \frac{(k^2 \omega^2 \theta^2 - k^2 - \omega^2)^2}{k^3 \omega^3}, \\
\pi_2 = -\frac{3}{4} \frac{(k^2 \omega^2 \theta^2 - k^2 - \omega^2)^2}{k^3 \omega^3}.
\]

(127)

According to Family I, (112) becomes

\[
\Psi_{\alpha}(q) = \frac{3(k^2 \omega^2 \theta^2 - k^2 - \omega^2)\theta/\omega}{-\left(\sqrt{\theta^2 - 4\delta/\omega}\right) \tanh \left(\left(\sqrt{\theta^2 - 4\delta/\omega}/2\right)(q + \Sigma) - (\theta/2\delta)\right) - \left(3/4\right) \frac{(k^2 \omega^2 \theta^2 - k^2 - \omega^2)^2}{k^3 \omega^3}.
\]

(128)

Fifth:

where

\[
\theta^2 - 4\delta = \frac{k^2 + \omega^2}{k^2 \omega^2} > 0, \quad q
\]

\[
= k \left(x + \frac{1}{I(\mu)}\right)^{\mu} \\
- \omega \left(t + \frac{1}{I(\mu)}\right)^{\mu}.
\]

(129)

\[
\delta = -\frac{144k^2 + 144\omega^2 - \tau_1^2}{576k^2 \omega^2}, \\
\theta = \left(-\frac{1}{12k\omega}\right)^{\mu} \frac{\tau_1}{12k\omega}, \\
\pi_0 = \frac{1}{48} \frac{48k^2 + 48\omega^2 - \tau_1^2}{k\omega}, \\
\tau_2 = -12k\omega.
\]

(130)
According to Family I, (112) can be written as

\[ \Psi^7_q = \frac{1}{48} k^2 + 48\Omega^2 - \tau_1^2 \]

\[ + \tau_1 \left( \frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \tanh \left( \frac{\sqrt{\theta^2 - 4\delta}}{2}(q + \Sigma) \right) - \frac{\theta}{2\delta} \right) \]

\[ - 12k\omega \left( \frac{\sqrt{\theta^2 - 4\delta}}{2\delta} \tanh \left( \frac{\sqrt{\theta^2 - 4\delta}}{2}(q + \Sigma) \right) - \frac{\theta}{2\delta} \right)^2, \]

(131)

where

\[ \frac{\theta}{2\delta} = \frac{24\tau_1 k\omega}{144k^2 + 144\omega^2 - \tau_1^2}, \theta^2 - 4\delta = \frac{k^2 + \omega^2}{k^2\omega^2}, \]

\[ > 0, q = k \left( x + \frac{1}{\Gamma(\alpha)} \right)^\alpha - \omega \left( t + \frac{1}{\Gamma(\alpha)} \right)^\alpha. \]

(132)

According to Family III, (112) becomes

\[ \Psi^8_q = \frac{1}{48} k^2 + 48\Omega^2 - \tau_1^2 \]

\[ + \tau_1 \left( \frac{\theta}{\exp(\theta(q + \Sigma)) - 1} \right) \]

\[ - 12k\omega \left( \frac{\theta}{\exp(\theta(q + \Sigma)) - 1} \right)^2, \]

(133)

where

\[ \tau_1 = 12\sqrt{k^2 + \omega^2}, \theta = -\frac{\sqrt{k^2 + \omega^2}}{k\omega}, q = k \left( x + \frac{1}{\Gamma(\mu)} \right)^\mu \]

\[ - \omega \left( t + \frac{1}{\Gamma(\mu)} \right)^\mu. \]

(134)
We expose the graphical representation of these solutions involving the importance physically. It has been investigated that all figures are dependent on the family conditions which are of different free parameters. These applied parameters have important conjugation, such as choosing various inputs of free parameters from an individual solution; known solutions must be found identically. It is important to notice that the new type solution of the space-time fractional (1 + 1)-dimensional Boussinesq equation, (2 + 1)-dimensional breaking soliton equations, and SRLW equations has not been exposed by the oncoming exp (−Ω(q)) -expansion technique in the previous literature. So we claim that in this current study, the obtained solutions are unique and thus could be more effective in the study of space-time fractional nonlinear physical phenomena. All calculations in this paper have been made quickly with the aid of Maple. The development of offered methods may allow the mitigating Internet bottleneck with quadratic-cubic nonlinearity to be used in more general configurations. The solutions are all verified by putting them back into the original equations with the aid of the Maple symbolic computation package 18.

8. Conclusion

In this study, the efficient and significant solutions to three nonlinear fractional models were established which include kink solution, periodic wave solution, singular kink, single soliton, and other types of soliton found by preferring different free parameters. These applied parameters have important conjugation, such as choosing various inputs of free parameters from an individual solution; known solutions must be found identically. It is important to notice that the new type solution of the space-time fractional (1 + 1)-dimensional Boussinesq equation, (2 + 1)-dimensional breaking soliton equations, and SRLW equations has not been exposed by the oncoming exp (−Ω(q)) -expansion technique in the previous literature. So we claim that in this current study, the obtained solutions are unique and thus could be more effective in the study of space-time fractional nonlinear physical phenomena. All calculations in this paper have been made quickly with the aid of Maple. The development of offered methods may allow the mitigating Internet bottleneck with quadratic-cubic nonlinearity to be used in more general configurations. The solutions are all verified by putting them back into the original equations with the aid of the Maple symbolic computation package 18.

Authors’ Contributions

The authors made contribution to this work. QL made the numerical simulations and wrote some sections of the article. DS, OAI, GS, and JM provided the remaining sections. JM and DS provided the conclusions. QL and OAI provided Section 4. GS and JM wrote Section 5. Also, QL,
DS, and JM provided figures. Moreover, JM and OAI provided the references. The authors read and approved the final manuscript.
