The Heisenberg ferromagnetic spin chain equation (HFSCE) is very important in modern magnetism theory. HFSCE expounded the nonlinear long-range ferromagnetic ordering magnetism. Also, it depicts the characteristic of magnetism to many insulating crystals as well as interaction spins. Moreover, the ferromagnetism plays a fundamental role in modern technology and industry and it is principal for many electrical and electromechanical devices such as generators, electric motors, and electromagnets. In this article, the exact solutions of the nonlinear $(2+1)$-dimensional HFSCE are successfully examined by an extended modified version of the Jacobi elliptic expansion method (EMVJEEM). Consequently, much more new Jacobi elliptic traveling wave solutions are found. These new solutions have not yet been reported in the studied models. For the study models, the new solutions are singular solitons not yet observed. Additionally, certain interesting 3D and 2D figures are performed on the obtained solutions. The geometrical representation of the HFSCE provides the dynamical information to explain the physical phenomena. The results will be significant to understand and study the $(2+1)$-dimensional HFSCE. Therefore, further studying EMVJEEM may help researchers to seek for more soliton solutions to other nonlinear differential equations.

1. Introduction and Main Results

The investigation of traveling wave solutions of nonlinear evolution equations (NLEEs) plays a key role in the study of the internal mechanisms of complex phenomena. In the last few decades, we have made imperative developments and found in the literature many powerful and skilled methods to obtain analytical traveling wave solutions, such as electromagnetism, liquid mechanics, atomic materials, complex physics, electrical engineering, optical fibers, and geochemistry [1–8]. As a result, a large number of mathematicians and physicists tried to invent various methods to obtain solutions to such equations. About describing various complex phenomena in the field of NLEEs, soliton theory plays a crucial role in a number of nonlinear models. Different scientists have studied the dynamics of solitons in different models. For instance, Belić [9] investigated analytical light bullet solutions of the generalized $(3+1)$-dimensional nonlinear Schrödinger equation in 2007. In recent years, Kumar et al. have made great achievements in the study of nonlinear differential equations of water wave models by using Lie symmetry analysis [10, 11].

exact bright, dark, and bright-dark solitary wave soliton solutions of the generalized higher order nonlinear NLS equation by using the amplitude ansatz method. The powerful sine-Gordon expansion method was utilized to search for the solutions to some important nonlinear mathematical models arising in nonlinear sciences by Bulut et al. [17]. Zayed et al. [18] investigated the soliton solutions to the nonlinear Schrödinger equation with fourth-order dispersion and dual power law nonlinearity.

In modern magnetic theory, the \((2 + 1)\)-dimensional HFSCE is considered as one of the very important equations to explain the dynamics of nonlinear magnets. The \((2 + 1)\)-dimensional HFSCE which is a suitable equation representing many insulating magnetic crystal properties and explaining spin-long ferromagnetic ordered interactions is of striking interest in the soliton theory. The soliton solutions for the \((2 + 1)\)-dimensional HFSCE equation are characterized by high quality and qualitative studies for a lot of phenomena and processes in various fields such as ferromagnetic materials, nonlinear optics, and optical fibers. In the meantime, the Heisenberg model of ferromagnetic spin chains with various magnetic interactions associated with nonlinear evolution equations exhibiting a neat and tidy behavior in the classical and semiclassical continuum limits [19]. Inhomogeneous exchange interactions are also good candidates for activating spin reversal processes in ferromagnets [20]. In 2014, Latha and Vasanthi [21] applied the complex envelope function and imaginary part, the modulus and is a complex number. If

\[
\beta_1 = \delta^4 (y + y_2), \beta_2 = \delta^4 (y_1 + y_2), \beta_3 = 2 \delta^4 y_2, \beta_4 = 2 \delta^4 B.
\]

Here the complex-valued function \(V(x, y, t)\) signifies the wave propagation, \(x, y\) are the spatial variables, and \(t\) is the time variable. The lattice parameter is represented as \(\delta\) with the interaction coefficients \(y, y_1, y_2\), while the anisotropic parameter [25, 27] is denoted as \(B\). In this section, we present a mathematical analysis of the proposed model. The complex wave transformation which has been taken into account to seek for the solitary solutions of HFSCE is of the next form:

\[
V(x, y, t) = \Phi(\xi)e^{it}, \tag{3}
\]

where the amplitude is denoted as \(\Phi(\xi)\) with \(\xi = x + y - \chi t\) and \(\theta = -lx + ky + at + \epsilon_2\) is the corresponding phase component. By (3), we deduce that:

\[
V_t = \left[ -\chi \Phi' + i\omega \phi \right] e^{it}, \tag{4}
\]

\[
V_{xx} = \left[ \phi'' - 2i\epsilon k \phi - l^2 \epsilon \phi \right] e^{it}, \tag{5}
\]

\[
V_{yy} = \left[ \phi'' - 2i\epsilon k \phi - k^2 \epsilon \phi \right] e^{it}, \tag{6}
\]

\[
V_{xy} = \left[ \phi'' - i(l - k)\phi' + ik \right] e^{it}. \tag{7}
\]

Inserting (3) and (4)–(7) into (1), the real part,

\[
(\beta_1 + \beta_2 + \beta_3)\Phi'' - (\omega + \beta_1 l^2 + \beta_2 k^2 - \beta_3 kl)\Phi - \beta_1 \Phi^3 = 0, \tag{8}
\]

and the imaginary part,

\[
\chi = 2\beta_3 l - 2\beta_2 k - \beta_3 k + \beta_3 l, \tag{9}
\]

the \(\beta_1, \beta_2, \beta_3, k, l\) are all nonzero parameters.

In 2021, based on the ideas of the Jacobi elliptic functions, Yang and Zhang [29] used the unified F-expansion method to study the Korteweg-De Vries partial differential equations. In 2021, Ünal et al. [30] also investigated the exact solutions of space-time fractional symmetric regularized long wave equation using ideas of JEFs.

Twelve kinds JEFs are available in literature [31]. Basic JEFs are expressed as \(\text{snc}(n; \xi; m)\) or \(\text{cn}(n; \xi; m)\) or \(\text{dn}(n; \xi; m)\) and other basic JEFs such as \(sc, cd, nd, nc, dc, ns, cs, \) and \(ds\). In addition, if \(m = 0\) and \(m = 1\), then the JEFs turn into trigonometric and hyperbolic functions. Here, \(m\) is the modulus and is a complex number. If \(m\) is real, it can be arranged \(0 < m^2 < 1\).

2. The Extend Modified Version of the Jacobi Elliptic Expansion Method

Based on the ideas of [30], we consider the following form of Equation (8), and we give the details of the extend modified
version of the Jacobi elliptic expansion method (EMVJEEM) and employ this method to seek for new and more general traveling wave exact solutions to Equation (8).

Step 1. Regarding that the solution of Equation (8) can be expressed by a polynomial in $K$ as follows:

$$
\Phi(\xi) = \sum_{j=0}^{N} a_j K^j(\xi),
$$

(10)

in Equation (8), $K = K(\xi)$ is satisfied the following differential equations:

$$
\left( K' \right)^2(\xi) = p K^4(\xi) + q K^2(\xi) + r,
$$

(11)

where $p$, $q$, and $r$ are arbitrary constants. $N$ can be determined by the uniform equilibrium term between the highest derivative and the nonlinear term appearing in (8). All the solutions $K(\xi)$ of (11) are listed in Table 1.

Step 2. Taking (10) into (8) and using (11), (8) is converted into another polynomial in $K$. Calculating all the coefficients of the polynomial to zero produces the system algebraic equations for $a_0, \ldots , a_N, p,q,$ and $r$.

Step 3. The constants $a_0, \ldots , a_N$ can be obtained by solving the system of algebraic equations obtained in Step 3. Since (11) may have the following many possible solutions. Thus, the exact solutions for given (8) can be derived. Here:

Step 4. Putting the inverse transform $T^{-1}$ into the solutions $\Phi(\xi)$ $(\xi = x-y \chi t)$, we can get all exact solutions $V(x,y,t) = \Phi(x,y,t) e^{i(-kx+\omega t+\epsilon)}$ of the original Equation (8).

Remark 1. In 2021, Hosseini et al. [27] only considered the four cases in Table 1 (such as Cases 1, 2, 9, and 10). Obviously, we consider a broader scenario in Table 1, and therefore, more new solutions will be obtained in this paper.

3. Employing the EMVJEEM to Equation (8)

Taking into account the homogeneous equilibrium term between $\Phi''$ and $\Phi''$ in (8), it is easy to deduce $N = 1$. The solution of (9) can be listed as follows:

$$
\Phi(\xi) = a_1 K + a_0 + b_1 K^{-1},
$$

(12)

here $a_0, a_1,$ and $b_1$ are unknown constants and will be determined later.

By using (12) and (11) and collecting all terms with the same power $K$ together, we deduce

$$
\Phi'(\xi) = a_1 K'(\xi) - b_1 K^{-2}(\xi)K'(\xi),
$$

(13)

$$
\Phi''(\xi) = 2pa_1 K^3(\xi) + a_1 qK(\xi) + b_1 qK^{-1}(\xi) + 2b_1 K^{-3}(\xi).
$$

(14)

Substituting (14) into (9), we obtain

$$
\begin{align*}
&\qquad (\beta_1 + \beta_2 + \beta_3) (2pa_1 K^3 + a_1 qK + b_1 qK^{-1} + 2b_1 K^{-3}) \\
&+ (\beta_3 kl - \omega - \beta_1 l^2 - \beta_2 k^2) \left( a_0 + a_1 K + b_1 K^{-1} \right) \\
&- \beta_4 \left( a_0 + a_1 K + b_1 \right)^3 = 0.
\end{align*}
$$

(15)

Sorting out all terms with the same power of $K$ together, we obtain

$$
\begin{align*}
&\qquad (2pa_1 + c_1) K^3 + ((\beta_1 + \beta_2 + \beta_3) a_1 q + a_1 (\beta_3 kl - \omega - \beta_1 l^2 - \beta_2 k^2) \\
&- 3\beta_4 a_1^2 - 3\beta_4 a_1 b_1) K + ((\beta_1 + \beta_2 + \beta_3) b_1 q \\
&+ b_1 (\beta_3 kl - \omega - \beta_1 l^2 - \beta_2 k^2) - 3\beta_4 a_1^2 b_1 - 3\beta_4 a_1 b_1^2) \frac{1}{K} \\
&+ (2b_1 r(\beta_1 + \beta_2 + \beta_3) - \beta_4 b_1^2) \frac{1}{K^2} + (a_0 (\beta_3 kl - \omega - \beta_1 l^2 - \beta_2 k^2) \\
&- \beta_4 a_0^2 - 6a_0 a_1 b_1 + 3a_0 a_1^2 b_4 K^2 - 3\beta_4 a_1 b_1^2 \frac{1}{K^2} = 0.
\end{align*}
$$

(16)

For the same term of function $K$, we are extracting their unknown coefficients and setting them to zero to get the next equation:

$$
\begin{align*}
&\quad a_0 (\beta_3 kl - \omega - \beta_1 l^2 - \beta_2 k^2) - \beta_4 a_0^2 - 6a_0 a_1 b_1 = 0, \\
&\quad (\beta_1 + \beta_2 + \beta_3) a_1 q + a_1 (\beta_3 kl - \omega - \beta_1 l^2 - \beta_2 k^2) - 3\beta_4 a_1^2 a_1 - 3\beta_4 a_1 b_1 = 0, \\
&\quad (\beta_1 + \beta_2 + \beta_3) b_1 q + (\beta_3 kl - \omega - \beta_1 l^2 - \beta_2 k^2) b_1 - 3\beta_4 a_1^2 b_1 - 3\beta_4 a_1 b_1^2 = 0, \\
&\quad 3a_0 a_1^2 b_4 = 0, \\
&\quad 3\beta_4 a_1 b_1^2 = 0, \\
&\quad 2b_1 r(\beta_1 + \beta_2 + \beta_3) - \beta_4 b_1^2 = 0, \\
&\quad 2pa_1 - \beta_4 a_1^2 = 0.
\end{align*}
$$

(17)

Solving this system of equations, the unknown coefficients are found:

$$
\begin{align*}
a_0 &= 0, \\
a_1 &= \pm \frac{2p}{\beta_4}, \\
b_1 &= \pm \frac{2r(\beta_1 + \beta_2 + \beta_3)}{\beta_4}
\end{align*}
$$

(18)

and \((\beta_1 + \beta_2 + \beta_3) q + \beta_3 kl - \omega - \beta_1 l^2 - \beta_2 k^2) = 36pr(\beta_1 + \beta_2 + \beta_3)\). From (3), we know that $\Phi(\xi)$ is the real function. Hence, $K(\xi)$ takes the real cases in Table 1, the forms as

\( = (9m^4/4)(\beta_1 + \beta_2 + \beta_3). \)

Case 24. If \( p = 1/4, q = (1 - 2m^2)/2, \) and \( r = 1/4, \) then \( K(\xi) = sn\xi \pm cs\xi \) or \(-sn\xi \pm cs\xi, \) or \( dc\xi \pm \sqrt{1 - m^2}sc\xi, \) or \(-dc\xi \pm \sqrt{1 - m^2}sc\xi \)
\[ \Phi_{339}(x + y - \chi t) = \pm \sqrt{\frac{m^4}{2\beta_4} \left( ns(x + y - \chi t) \right)} \]
\[ \pm \sqrt{\frac{m^4(\beta_1 + \beta_2 + \beta_3)}{2\beta_4}} \left( \frac{1}{ns(x + y - \chi t) \pm cs(x + y - \chi t)} \right), \]
(81)
or

\[
\Phi_{340}(x+y-\chi t) = \pm \sqrt{\frac{1}{2\beta_4}} \left( -\text{ns}(x+y-\chi t) \mp \text{cs}(x+y-\chi t) \right)
\]
\[
\pm \sqrt{\frac{1}{2\beta_4}} \left( \beta_1 + \beta_2 + \beta_3 \right)
\]
\[
\cdot \left( -\text{ns}(x+y-\chi t) \mp \text{cs}(x+y-\chi t) \right)
\]
\[
\cdot \left( \frac{1}{\text{dc}(x+y-\chi t) \pm \sqrt{1 - m^2 \text{sc}(x+y-\chi t)}} \right),
\]
(82)

or

\[
\Phi_{341}(x+y-\chi t) = \pm \sqrt{\frac{1}{2\beta_4}} \left( \text{dc}(x+y-\chi t) \pm \sqrt{1 - m^2 \text{sc}(x+y-\chi t)} \right)
\]
\[
\pm \sqrt{\frac{1}{2\beta_4}} \left( \beta_1 + \beta_2 + \beta_3 \right)
\]
\[
\cdot \left( \frac{1}{\text{dc}(x+y-\chi t) \pm \sqrt{1 - m^2 \text{sc}(x+y-\chi t)}} \right),
\]
(83)

or

\[
\Phi_{342}(x+y-\chi t) = \pm \sqrt{\frac{1}{2\beta_4}} \left( -\text{dc}(x+y-\chi t) \mp \sqrt{1 - m^2 \text{sc}(x+y-\chi t)} \right)
\]
\[
\pm \sqrt{\frac{1}{2\beta_4}} \left( \beta_1 + \beta_2 + \beta_3 \right)
\]
\[
\cdot \left( -\text{dc}(x+y-\chi t) \mp \sqrt{1 - m^2 \text{sc}(x+y-\chi t)} \right)
\]
\[
\cdot \left( \frac{1}{\text{dc}(x+y-\chi t) \pm \sqrt{1 - m^2 \text{sc}(x+y-\chi t)}} \right),
\]
(84)

and \((\beta_1 + \beta_2 + \beta_3) (1 - 2m^2/2) + (\beta_1 \beta_2 - \beta_1^2 - \beta_2^2)\)² = 9/4(\(\beta_1 + \beta_2 + \beta_3\)),

Besides, if \(m \to 0\) and \(m \to 1\), then the Jacobi elliptic functions become vestigial trigonometric and hyperbolic functions ([131]). Now we give specific examples as follows:

**Case 3** If \(m \to 0\) then \(cs\xi \to \cot\xi\), then

\[
\Phi_{35}(x+y-\chi t) = \pm \left( \frac{2}{\beta_4} \cot (x+y-\chi t) \right)
\]
\[
\pm \sqrt{\frac{2(\beta_1 + \beta_2 + \beta_3)}{\beta_4}} \tan (x+y-\chi t);
\]
(89)

\[
V_{35}(x+y-\chi t) = \Phi_{35}(x+y-\chi t)e^{i(\text{cs}h\xi + \text{ct}\xi)},
\]
\[
= \left( \pm \frac{2}{\beta_4} \cot (x+y-\chi t) \right)
\]
\[
\pm \sqrt{\frac{2(\beta_1 + \beta_2 + \beta_3)}{\beta_4}} \tan (x+y-\chi t),
\]
\[
e^{i(\text{cs}h\xi + \text{ct}\xi)},
\]
(90)

and \((2(\beta_1 + \beta_2 + \beta_3) + (\beta_1 \beta_2 - \beta_1^2 - \beta_2^2))² = 36(\beta_1 + \beta_2 + \beta_3)\).

If \(m \to 1\) then \(cs\xi \to csch\xi\), and

\[
\Phi_{35}(x+y-\chi t) = \pm \left( \frac{2}{\beta_4} \text{csch} (x+y-\chi t) \right)
\]
\[
\pm \sqrt{\frac{2}{\beta_4}} \text{csch} (x+y-\chi t);
\]
(91)
\[ V_{35}(x + y - \chi t) = \Phi_{35}(x + y - \chi t)e^{(i(-\chi y + \omega t + \varepsilon_1))} \]
\[ = \pm \sqrt{\frac{2}{\beta_4}} \text{csch} \ (x + y - \chi t)e^{(i(-\chi y + \omega t + \varepsilon_1))}, \]
\[ \text{(91)} \]
\[ \text{and} \ ((\beta_1 + \beta_2 + \beta_3) + (\beta_2 k l - \omega - \beta_1 l^2 - \beta_2 k^2))^2 = 0. \]

Case 15. If \( m \to 0 \), then \( ds\xi \pm cs\xi \to \csc \xi \pm \cot \xi \) or
\[ \Phi_{315}(x + y - \chi t) = \pm \sqrt{\frac{1}{2\beta_4}} \text{csch} \ (x + y - \chi t) \pm \cot (x + y - \chi t) \]
\[ \pm \sqrt{\left[ \frac{\beta_1 + \beta_2 + \beta_3}{2\beta_4} \right] \left( \text{csch} \ (x + y - \chi t) \pm \cot (x + y - \chi t) \right)} \] \[ \text{(92)} \]

or

\[ \Phi_{318}(x + y - \chi t) = \pm \sqrt{\frac{1}{2\beta_4}} (-\csc (x + y - \chi t) \mp \cot (x + y - \chi t)) \]
\[ \pm \sqrt{\frac{\beta_1 + \beta_2 + \beta_3}{2\beta_4}} \frac{1}{\csc (x + y - \chi t) \mp \cot (x + y - \chi t)} ; \]
\[ \text{(93)} \]

\[ V_{317}(x + y - \chi t) = \Phi_{317}(x + y - \chi t)e^{(i(-\chi y + \omega t + \varepsilon_1))} \]
\[ = \left( \pm \sqrt{\frac{1}{2\beta_4}} (\csc (x + y - \chi t) \pm \cot (x + y - \chi t)) \right) \]
\[ \pm \sqrt{\frac{\beta_1 + \beta_2 + \beta_3}{2\beta_4}} \frac{1}{(\csc (x + y - \chi t) \pm \cot (x + y - \chi t))} e^{(i(-\chi y + \omega t + \varepsilon_1))} , \]
\[ \text{(94)} \]

or

\[ V_{318}(x + y - \chi t) = \Phi_{318}(x + y - \chi t)e^{(i(-\chi y + \omega t + \varepsilon_1))} = \left( \pm \sqrt{\frac{1}{2\beta_4}} (-\csc (x + y - \chi t) \mp \cot (x + y - \chi t)) \right) \]
\[ \pm \sqrt{\frac{\beta_1 + \beta_2 + \beta_3}{2\beta_4}} \frac{1}{(\csc (x + y - \chi t) \mp \cot (x + y - \chi t))} e^{(i(-\chi y + \omega t + \varepsilon_1))} , \]
\[ \text{(95)} \]

and \((\beta_1 + \beta_2 + \beta_3)((1 + m^2)/2) + (\beta_3 k l - \omega - \beta_1 l^2 - \beta_2 k^2))^2 = (9(1 - m^2)^2/4)(\beta_1 + \beta_2 + \beta_3)\).

Case 23. If \( m \to 1 \), then \((sn\xi/1 \pm dn\xi) \to (\tanh \xi/1 \pm sech\xi)\) and

\[ \Phi_{325}(x + y - \chi t) = \pm \sqrt{\frac{1}{2\beta_4}} \left( \frac{\tanh (x + y - \chi t)}{\text{sech} (x + y - \chi t)} \right) \]
\[ \pm \sqrt{\frac{\beta_1 + \beta_2 + \beta_3}{2\beta_4}} \left( \frac{1 \pm \text{sech} (x + y - \chi t)}{\tanh (x + y - \chi t)} \right) , \]
\[ \text{(96)} \]

and \((\beta_1 + \beta_2 + \beta_3)(-1/2) + (\beta_3 k l - \omega - \beta_1 l^2 - \beta_2 k^2))^2 = 9/4 \]
\[(\beta_1 + \beta_2 + \beta_3). \]
4. Comparison

In this paper, employing the EMVJEEM to the HFSCE, we found that various forms exact solutions for HFSCE. In 2021, Ünal et al. [30] investigated the exact solutions of space-time fractional symmetric regularized long wave equation using ideas of the Jacobi elliptic functions. In our paper, Equation (10) is \( \Phi(\xi) = \sum_{j=-N}^{N} a_j K^j(\xi) \). Here, \( j \) starts from the negative number to the corresponding positive number. However, in [30], \( j \) only takes 0, 1, \( \cdots \), \( N \), this is the biggest difference of [30]. From there, \( j \) can take the negative number; our form is more extensive than [30].

Comparing with [29, 32], our article still varies greatly. In this paper, Equation (11) is \( (K')^2(\xi) = r + qK^2(\xi) + pK^4(\xi) \). However, in [29, 32], what is similar to Equation (11) is \( (K')^2(\xi) = a_0 + a_1 K + a_2 K^2 + a_3 K^3 + a_4 K^4 \). Due to the importance of Formula (11), this is obviously a big difference between our paper and [29].

From the perspective of the complex calculation process, our paper is more complex than [27, 30]. At the same time, the results in our paper are more concise and clearer than [29, 32].

Recently, the complex method [33, 34] is used to study the exact solutions of nonlinear evolution equations and found the Weierstrass elliptic functions (WEFs) solution, hyperbolic function or trigonometric meromorphic solutions, and rational solutions. In our paper, we also can find more solutions by the EMVJEEM, including hyperbolic function solutions or trigonometric solutions. The WEFs solutions \( \varphi(\xi) \) satisfy the equation \( (K')^2(\xi) = 4K^3(\xi) - g_2 K(\xi) - g_3 \). In this paper, Equation (11) is \( (K')^2(\xi) = pK^4(\xi) + gK^2(\xi) + r \). In the above two equations, \( K \) of 3 power varies greatly from \( K \) of 4 power. At the same time, the relationship between the JEFs and WEFs is

\[
\varphi(\xi, g_2, g_3) = k_2 - (k_2 - k_3)cn^2\left(\sqrt{k_1 - k_3}; m\right),
\]

here \( m^2 = (k_2 - k_3)/(k_1 - k_3) \) is the modulus number of JEFs and \( k_i (i = 1, 2, 3, k_1 \geq k_2 \geq k_3) \) are the roots of equation \( 4e^2 - g_2 e^2 - g_3 = 0 \).

It is well know that if \( m \rightarrow 1 \) and \( e_2 \rightarrow e_1 \), then \( cn(\xi; m) \rightarrow sech(\xi) \), or if \( m \rightarrow 0 \) then \( cn(\xi; m) \rightarrow \cos(\xi) \). Equation (97) is the bridge linking among the WEFs, hyperbolic function, trigonometric function, and JEFs.

5. Computer Simulations

In this section, we are trying to explain the results through computer simulation images and further analyze the nature of the \( \Phi_{35}(\xi) \), \( \Phi_{317}(\xi) \), \( \Phi_{318}(\xi) \), and \( \Phi_{335}(\xi) \) in the equations.

Figure 1 The 3D, 2D, and contour images of \( \Phi_{35}(\xi) \).
Figure 3: The 3D, 2D, and contour images of $\Phi_{317}(\xi)$, we take the values of $\beta_1 = 1$, $\beta_2 = 4$, $\beta_3 = 3$, $\beta_4 = 2$, $y = 1$, and $q = 1$; the graphs clearly demonstrate the multiperiodic characteristic of $\Phi_{317}(\xi)$ on the domain.

Figure 4: The 3D, 2D, and contour images of $\Phi_{318}(\xi)$, we take the values of $\beta_1 = 1$, $\beta_2 = 4$, $\beta_3 = 3$, $\beta_4 = 2$, $y = 1$, and $q = 1$; the graphs show the periodic curved parabolic structure of $\Phi_{318}(\xi)$ on the domain.
Figure 5: The 3D, 2D, and contour images of $\Phi_{335}(\xi)$ by considering the values $\beta_1 = 1$, $\beta_2 = 4$, $\beta_3 = 3$, $\beta_4 = 2$, $y = 1$, and $q = 1$; the graphs demonstrate the interactions between one soliton with kink waves of $\Phi_{335}(\xi)$ on the domain.

The all above wave profiles solutions of HFSCE keep their velocities, shapes, and amplitudes invariant during the appropriate value of some specific parameters. In Figures 1, 3,and 4(a), we can see M-shaped waves train. In
Figures 2 and 5(a), we also see the multiple bright and dark peak solitons and also seen their behavior in contour (Figures 1–5(c)) and 2D (Figures 1–5(b)) structures, respectively.

6. Conclusion and Future Study

The EMVJEEM was implemented perfectly for the first time in the framework of these techniques to design these new types of soliton solutions for this model. The achieved soliton solutions show the potentially traveling wave solutions to the (2 + 1)-dimensional HFSCE. The resulting sample of the achieved solutions offers a rich podium to study the non-linear spin dynamics in magnetic materials. The derived solutions having abundant applications to handle spin dynamics in magnetic materials and transmission of high-frequency waves in tranquil medium. We have successfully used EMVJEEM to construct a rich variety of exact solutions of HFSCE under various family cases in this paper. By choosing suitable best values for the constant parameters, these new complex soliton solutions established the dynamical behaviors through 3D and 2D wave profiles via simulation. When compared with [27, 35], our paper has the largest number solutions. Because there are 42 types of linear independent solutions for 23 different cases in the presented method. Hence, these new exact solutions will play an important role in understanding and investigating the HFSCE.

In summary, the results of the full text eloquently prove that the above EMVJEEM is very efficient and powerful in solving the exact solutions of nonlinear evolution equations now and in the future. We can apply EMVJEEM of this research to other nonlinear evolution equations.

In the meanwhile, we notice if there is additional noise, the equation becomes a stochastic differential equation (SDE),

\[(\beta_1 + \beta_2 + \beta_3)\Phi^{(1)} - (\omega + \beta_1 \xi^2 + \beta_3 \xi^2 - \beta_3 \Phi)\Phi - \beta_3 \Phi^3 - \xi = 0.\] (98)

This model, compared to the previous model (8), is more pervasive in scientific computing experiments, for the reason that such noise exists in both complicated nature phenomenon and artificial model errors. Usually, the noise is Gaussian white noise. According to the theory of existence and uniqueness of solution to SDE, one can find solution to the SDE problem (98) under certain conditions [36].

Numerical solutions can also be found by various methods, for example, the Runge-Kutta method [37], the Euler method [38, 39], and the Milstein method [40, 41]. Since the Runge-Kutta method is far more complicated than the Euler method and the Milstein method, one usually performs the Euler method and the Milstein method in real applications. One can perform numerical experiments to the SDE and compare the strong and weak convergence, numerical errors, and stability of the numerical methods [42].

For the noise perturbed system (8), one can observe the property of energy landscape and the phenomenon of exit from basin of attraction under the framework of the large deviation theory [43]. We will discuss about that in later work. From the data assimilation point of view, when Equation (8) has unobservable state \(\Phi\) and noisy observations of \(\Phi\), one can perform filtering strategy to recover the state \(\Phi\), based on the a the Bayesian framework [44]. We will also explore this issue in future work.
