Table S1.

Table S1. Demographic, clinical and neuropsychological data in normal control (NC), mild cognitive impairment (MCI) and Alzheimer's disease (AD) subjects.

	NC(n=27)	MCI(n=27)	AD(n=35)	p value
Gender (M/F)	16/11	13/14	12/23	0.143
Age (year)	69.2±6.5	73.8±7.8	72.4±8.5	0.09
MMSE	28.9±1.0	26.8±1.8 ^a	19.7±4.1 ^{a,b}	<0.001
CDR	0	0.5	1.3±0.5 ^{a,b}	<0.001
AVLT-Immediate Recall ^c	5.9±1.1	4.6±1.5	2.6±1.6 ^{a,b}	<0.001
AVLT-Delay Recall ^c	5.8±2.0	3.1±2.0 ^a	0.6±1.2 ^{a,b}	<0.001
Head Motion	0.25±0.27	0.16±0.10	0.30±0.27	0.084

Chi-square was used for gender comparisons, One-way ANOVA with Bonferroni post hoc test was used for age, and neuropsychological tests comparisons

^aSignificant compared to NC. ^bSignificant compared to MCI. ^cThree AD subjects refuse to continue this test.

MMSE, mini-mental state examination; CDR, Clinical Dementia Rating; AVLT, auditory verbal learning test.

Note: For all the data was the same with our previous studies([Zhou et al., 2013](#), [Zhang et al., 2014](#)), hence the data information is the same with those papers.

Note: The abbreviations are listed in Table S2.

Color Fonts mean the strength of the impaired functional connectivity significant correlated with MMSE.

Figure S1.

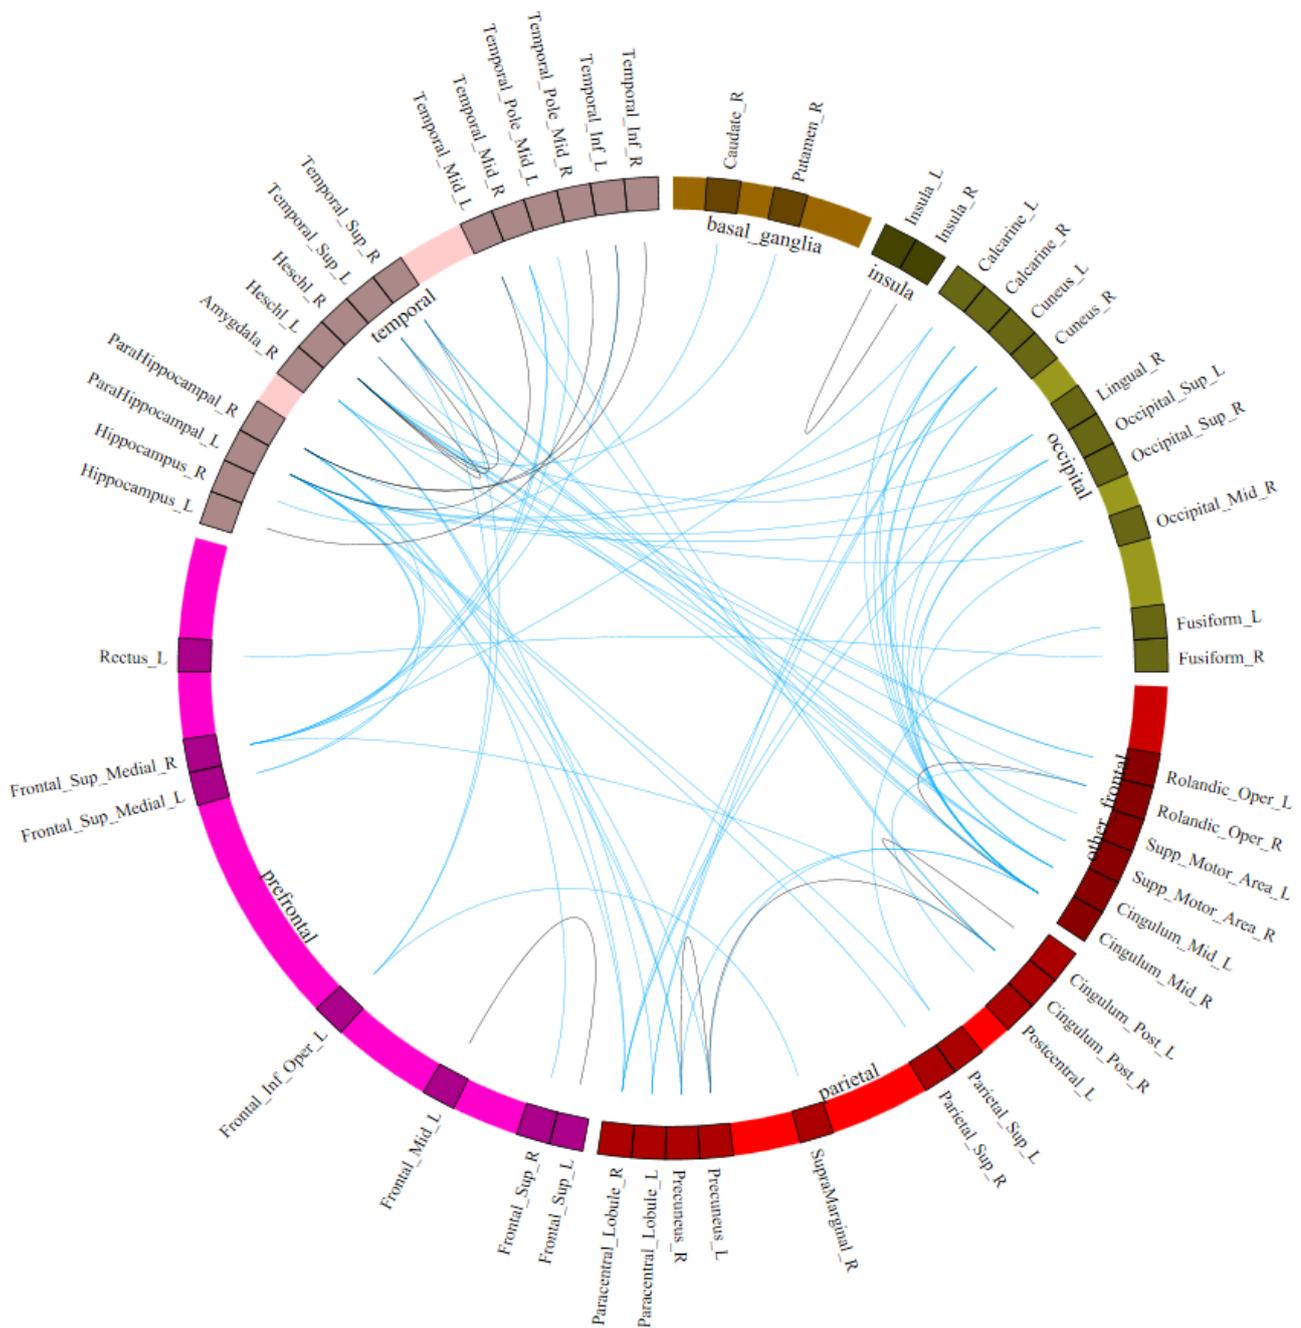

Figure S1. Distributed of the impaired functional connectivity in AD. Each line indicates the mean strength of the functional connectivity between each pair of brain regions. Blue lines represent inter connectivity between lobes and grey lines mean intra connectivity within the defined lobes in Table S2. Detail for these connectivity and it's related to MMSE can be found at Table S3 and Figure 3.
