This paper presents the problem of robust and nonfragile stabilization of nonlinear systems described by multivariable Hammerstein models. The objective is focused on the design of a nonfragile feedback controller such that the resulting closed-loop system is globally asymptotically stable with robust $H_\infty$ disturbance attenuation in spite of controller gain variations. First, the parameters of linear and nonlinear blocks characterizing the multivariable Hammerstein model structure are separately estimated by using a subspace identification algorithm. Second, approximate inverse nonlinear functions of polynomial form are proposed to deal with nonbijective invertible nonlinearities. Thereafter, the Takagi–Sugeno model representation is used to decompose the composition of the static nonlinearities and their approximate inverses in series with the linear subspace dynamic submodel into linear fuzzy parts. Besides, sufficient stability conditions for the robust and nonfragile controller synthesis based on quadratic Lyapunov function, $H_\infty$ criterion, and linear matrix inequality approach are provided. Finally, a numerical example based on twin rotor multi-input multi-output system is considered to demonstrate the effectiveness.

1. Introduction

The nonlinear modeling of real-world processes, which are complex in nature, remains a challenging problem. However, much research works remain to be done for realization on nonlinear mathematical models that accurately represent these processes [1–4]. One way to cope with this difficulty is to use the block-oriented nonlinear models [5–7], which represent a combination of static nonlinear components and linear dynamic submodels. These models are popular in nonlinear modeling because of their advantages to be quite simple to understand and easy to use [8], for instance, the Hammerstein model (a static nonlinear component followed by a linear submodel), Wiener model (a linear submodel followed by a static nonlinear component), and Hammerstein–Wiener model (a linear submodel sandwiched by two static nonlinearities or vice versa). In particular, the simplest model structure of them is the Hammerstein model, which has been extensively used for modeling electrical generators [9], chemical processes [10], and biological processes [11] and is also used in signal processing applications [12].

Over the past decades, various parametric subspace identification methods have been very successful for the modeling of multivariable Hammerstein models. These methods include the iterative identification approach [13, 14], the overparameterization method [15], the blind approach [16], the instrumental variables method [17], the stochastic approach [18], and the least square support vector machines [19]. Most of them are based on the numerical subspace state-space system identification algorithm [20], the canonical variate analysis approach [21], and the multivariable output error state-space (MOESP) algorithm [10, 22].

From a control point of view, the conventional control scheme of a Hammerstein model has introduced the inverse of the nonlinear block into the appropriate place. This leads to reject the nonlinearity effect in the controller design [23]. Hence, the nonlinear control strategy problem is converted into a new linear one; also, any standard linear controller for a linear dynamic submodel can be applied. It should be a strong assumption that this nonlinearity is supposed to be exactly invertible [24–26]. In contrast, the performance of
this strategy becomes limited when the nonlinear component function is not bijective. In this view, many algorithms and approximations are used in the literature to determine the corresponding nonlinearity inverse. One may refer to latest research works based on polynomial form approximation [23, 27, 28], Bernstein–Bezier neural network [29], De Boor algorithm [30], and rational B-spline model approximation [31].

On the other hand, many studies have been devoted to the robust and nonfragile controller design problem for complex systems. Indeed, it is clear that relatively small perturbations in controller gain parameters can result in instability of the controlled system [32, 33]. Hence, it is necessary that any controller should be able to tolerate some bounded uncertainty in its parameters [3, 24, 34, 39]. For instance, a nonfragile controller for uncertain nonlinear networked control systems was investigated for uncertain large-scale systems. Lee et al. [38] proposed a nonfragile fuzzy $H_{\infty}$ controller for nonlinear systems described in Takagi–Sugeno (T-S) fuzzy model, and so on. To our best knowledge, the nonfragile control problem for Hammerstein models has not been treated yet.

In this framework, we use the MOESP subspace identification algorithm, which mainly involves two aspects: (i) determining the order of the system and obtaining the structure of the estimated state-space model and (ii) identifying the mathematical model’s unknown parameters from the available input-output data [10]. Afterwards, we propose a new control strategy for multivariable Hammerstein model including approximate inverse nonlinearities of polynomial form. Using then the T-S fuzzy model representation [1, 2, 34, 39], the composed nonlinear functions of the considered static nonlinearities and their approximate inverses in series with the linear dynamic submodel are decoupled into linear fuzzy parts. The resulting model is finally obtained by interpolating the constructed linear fuzzy parts through nonlinear fuzzy membership functions [2, 4, 35, 40]. In this regard, a nonfragile $H_{\infty}$ feedback controller is designed subject to controller gain variations guaranteeing both the stability and disturbance attenuation of the controlled nonlinear system.

The main contributions of this paper are listed as follows:

(i) A modified subspace-based algorithm is used to identify nonlinear systems described by multivariable Hammerstein models.

(ii) Compared with the existing results using the normal nonlinearity inversion method, we derive a new control strategy based on approximate inverse nonlinear functions of polynomial form. Furthermore, we appeal the T-S fuzzy model representation to decompose the existing nonlinearities and facilitate the controller synthesis.

(iii) From a control point of view, we develop a robust and nonfragile $H_{\infty}$ controller with variation in the control law that guarantees both the asymptotic stability and disturbance attenuation of the controlled nonlinear system and its identified multivariable Hammerstein model.

(iv) Besides, sufficient controller design conditions in terms of linear matrix inequalities (LMIs) are established, which can be efficiently solved by convex optimization techniques.

Following the introduction, this paper is organized as follows. The subspace identification method for multivariable Hammerstein model is presented in Section 2. Section 3 is reserved to the stability analysis and nonfragile $H_{\infty}$ control synthesis. A numerical example based on twin rotor multi-input multi-output system (TRMS) is considered in Section 4 to demonstrate the effectiveness.

2. MOESP Algorithm-Based Subspace Identification

We consider the multi-input multi-output (MIMO) Hammerstein model configuration, as depicted in Figure 1. As mentioned obviously, the model’s structure consists of $m$-static nonlinearities $f_i(\cdot)$ followed by a linear dynamic submodel.

More precisely, each nonlinear component $f_i(\cdot)$, for $i = 1, 2, \ldots, m$, is characterized by the following form:

$$v_{i,k} = f_i(u_{i,k}) = \lambda_{i1}u_{i,k} + \lambda_{i2}u_{i,k}^2 + \cdots + \lambda_{i}\upsilon_{i,k},$$

and the linear dynamic submodel is described by the following state-space representation:

$$\begin{align*}
x_{k+1} &= Ax_k + B_1V_k + B_2w_k, \\
Y_k &= Cx_k + DV_k + \epsilon_k,
\end{align*}$$

where $x_k \in \mathbb{R}^n$ is the state vector, $V_k = (v_{1,k} v_{2,k} \cdots v_{m,k})$ is the unmeasurable output, $w_k \in \mathbb{R}^n$ is the external disturbance vector, $\epsilon_k \in \mathbb{R}^q$ is the measurement noise vector, $u_k = (u_{1,k} u_{2,k} \cdots u_{m,k})$ is the input vector, $Y_k = (y_{1,k} y_{2,k} \cdots y_{m,k})$ is the output vector, and the notation $(\cdot)$ denotes the transposed element. $A \in \mathbb{R}^{n\times n}$, $B_1 = (B_{11} B_{12} \cdots B_{1m}) \in \mathbb{R}^{n\times m}$, $B_2 \in \mathbb{R}^{n\times m}$, $C \in \mathbb{R}^{q\times n}$, and $D = (D_1 D_2 \cdots D_m) \in \mathbb{R}^{q\times m}$ are unknown state-space matrices.

By substituting (1) into (2), we obtain the following open-loop model:

$$\begin{align*}
x_{k+1} &= Ax_k + B_1^iU_k + B_2^i w_k, \\
Y_k &= Cx_k + D_1^iU_k + \epsilon_k,
\end{align*}$$

where $U_k = (U_{1,k} U_{2,k} \cdots U_{m,k})$, $U_{i,k} = (u_{i,k} u_{i,k}^2 \cdots u_{i,k}^m)$, $B_1^i = (B_{11} B_{12} \cdots B_{1m})$, $D_1^i = (D_{11} D_{12} \cdots D_{1m})$, $B_2^i = B_2^i \lambda_{i\text{vec}}$, $D_1^i = D_1^i \lambda_{i\text{vec}}$, and $\lambda_{i\text{vec}} = (\lambda_{i1} \lambda_{i2} \cdots \lambda_{i2})$ for $i = 1, 2, \ldots, m$.

In order to estimate the system order and determine the unknown elements, as are presented in system (3), we use the MOESP algorithm, which is basically defined by the following steps:
Complexity

3. Nonfragile $H_\infty$ Control Scheme Design

In this section, we discuss sufficient conditions that guarantee the global asymptotic stability in closed loop of the following system:

$$\begin{align*}
x_{k+1} &= Ax_k + B_1 V_k + B_2 w_k, \\
z_k &= C_2 x_k + D_1 V_k + D_2 w_k,
\end{align*}$$

where $C_2 \in \mathbb{R}^{p \times n}$ is the output matrix of the controlled output vector $z_k \in \mathbb{R}^p$, $D_1 \in \mathbb{R}^{p \times r}$, and $D_2 \in \mathbb{R}^{p \times m}$.

In what follows, we assume that the $m$-nonlinearities:

$$v_{i,k} = f_i(u_{i,k}) = u_{i,k} + \lambda_{i2} u_{i,k}^2 + \cdots + \lambda_{i\nu_i} u_{i,k}^\nu_i,$$

are not bijective and approximated of the following form:

$$u_{i,k} = f_{i,\text{app}}(\bar{v}_{i,k}) = \beta_{i1} \bar{v}_{i,k} + \beta_{i2} \bar{v}_{i,k}^2 + \cdots + \beta_{i\nu_i} \bar{v}_{i,k}^\nu_i + \text{hot},$$

where (hot) denotes the higher order terms. As the nonlinearities (9) and (10) are in series, we may write

$$v_{i,k} = \psi_i(\bar{v}_{i,k}) = f_i(f_{i,\text{app}}(\bar{v}_{i,k})).$$

In addition, the parameters $\beta_{ij}$ are determined by solving $\bar{v}_i(+\infty) = v_i(+\infty)$, for $i = 1, 2, \ldots, m$. An example of calculation for the order $v = 3$ is detailed in Appendix A.

With the above approximation, system (8) is transformed as follows:

$$\begin{align*}
x_{k+1} &= Ax_k + B_1^p \bar{V}_k + B_2 w_k, \\
z_k &= C_2 x_k + D_1^p \bar{V}_k + D_2 w_k,
\end{align*}$$

where $B_1^p = (B_{11}^p, B_{12}^p, \ldots, B_{1m}^p)$, $D_1^p = (D_{11}^p, D_{12}^p, \ldots, D_{1m}^p)$, $B_2^p = B_2 (\bar{v}_{1,k}, \bar{v}_{2,k}, \ldots, \bar{v}_{m,k})$, $D_1^p = D_1 (\bar{v}_{1,k}, \bar{v}_{2,k}, \ldots, \bar{v}_{m,k})$, for $i = 1, 2, \ldots, m$. $\rho_{i,k}$ is determined by solving $\bar{v}_{i,k} = (\bar{v}_{1,k}, \bar{v}_{2,k}, \ldots, \bar{v}_{m,k})^T$.

Using then the polytopic transformation method, the $m$–nonlinearities $\rho_{i,k}$ are decomposed as follows:

$$\rho_{i,k}(\bar{v}_{i,k}) = H_1^i(\bar{v}_{i,k}) \sigma_i + H_2^i(\bar{v}_{i,k}) \sigma,$$

with

$$H_1^i(\bar{v}_{i,k}) = \frac{\rho_{i,k}(\bar{v}_{i,k}) - \sigma_i}{\sigma_i - \sigma},$$

$$H_2^i(\bar{v}_{i,k}) = 1 - H_1^i(\bar{v}_{i,k}),$$

where $\sigma_i$ and $\sigma$ are the maximum and minimum of $\rho_i(\bar{v}_{i,k})$, respectively.

For the convenience of notations, we define $H_1^i = H_1^i(\bar{v}_{i,k})$, $u_i = u_i(\bar{v}_{i,k})$, and $h_i = h_i(\bar{v}_{i,k})$.

Thereafter, we construct the following fuzzy subsystems:

\begin{enumerate}
  \item If $\bar{v}_{1,k}$ is $H_1^i$ and $\bar{v}_{2,k}$ is $H_2^i$ and \ldots, $\bar{v}_{m,k}$ is $H_m^i$, then $x_{i,k+1} = Ax_k + B_1 \bar{V}_k + B_2 w_k, z_k = C_2 x_k + D_1 \bar{V}_k + D_2 w_k$.
  \item If $\bar{v}_{1,k}$ is $H_1^i$ and $\bar{v}_{2,k}$ is $H_1^i$ and \ldots, $\bar{v}_{m,k}$ is $H_m^i$, then $x_{i,k+1} = Ax_k + B_1 \bar{V}_k + B_2 w_k, z_k = C_2 x_k + D_1 \bar{V}_k + D_2 w_k$.
\end{enumerate}
Theorem 1. The equilibrium $(x = 0_{2n})$ of the closed-loop system (23) is quadratically and globally asymptotically stable with decay rate $\alpha$ if there exist positive scalars $\mu, \tau_1, \tau_2, \delta_{12} = \tau_1^{-1} + \tau_2^{-1}$, and $\beta \in \{0, 1\}$, a common symmetric positive definite matrix $X \in \mathbb{R}^{m \times mn}$, and $M \in \mathbb{R}^{m \times mn}$ verifying the following LMI formulation:

$$
\begin{align*}
&\text{minimize} \quad \beta \\
&\text{subject to} : \\
&-\beta X \quad * \quad * \quad * \quad * \\
&0 \quad -\gamma^2 I \quad * \quad * \quad * \\
&AX - \bar{B}_iM \quad B_2 \quad -\ell_{33,j} \quad * \quad * \\
&C_xX - \bar{D}_1M \quad D_2 \quad 0 \quad -\ell_{44,j} \\
&M \quad 0 \quad 0 \quad 0 \quad -\delta_{12}I
\end{align*}
$$

(25)

Then, the feedback gain $K$, as shown in (22), is calculated by using the following relation:

$$
K = MX^{-1}.
$$

(26)

Proof. The controlled system (23) is globally asymptotically stable with decay rate $\alpha$ if there exist a discrete-time quadratic Lyapunov function $V_{\text{lyap}}(x_k) = x_k^2P x_k > 0$ and a positive scalar $0 < \alpha < 1$ such that

$$
\Delta V_{\text{lyap}}(x_k) \leq (\alpha^2 - 1)V_{\text{lyap}}(x_k),
$$

(27)

where $\Delta V_{\text{lyap}}(x_k) = V_{\text{lyap}}(x_{k+1}) - V_{\text{lyap}}(x_k)$ and $P \in \mathbb{R}^{mn \times mn}$ is a symmetric positive definite matrix. By considering (27) in (24), we may write

$$
\Delta V_{\text{lyap}}(x_k) - (\alpha^2 - 1)V_{\text{lyap}}(x_k) + z_k^2 z_k - \gamma^2 w_k^2w_k < 0.
$$

(28)

By, respectively, substituting the dynamics of $x_{k+1}$ and $z_k$ into (28), it becomes

$$
\begin{align*}
\sum_{i=1}^{\zeta} \bar{h}_i(x_k) &\quad \upharpoonright_{w_k} \quad \Gamma_i(x_k) < 0,
\end{align*}
$$

(29)

where $\Gamma_i = \left( \begin{array}{cccc} C_{i+1}^T P G_i - \alpha^2 P + F_i^T F_i & * \\
B_2^2 P G_i + D_1^T D_2 & B_2^2 P B_2 + D_1^T D_2 - \gamma^2 I \end{array} \right)$ and the symbol $(*)$ represents the transposed element in the symmetric position.

As the nonlinear functions $h_i \in [0, 1]$, matrix inequality (29) is equivalent to $\Gamma_i < 0$, for $i = 1, 2, \ldots, \zeta$. Using the Schur Complement, as is presented in Appendix B, we get

$$
\begin{align*}
0 &\quad -\gamma^2 I \quad * \quad * \\
F_i &\quad D_2 \quad 0 \quad -I
\end{align*}
$$

(30)
Denoting $X = P^{-1}$, $M = KX$, and $\beta = \alpha^2$ and, respectively, premultiplying and postmultiplying (30) by positive definite matrix $\text{diag}(X, I, X, I)$ yields
\[
\begin{pmatrix}
-\beta X & * & * & * \\
0 & -\gamma^2 I & * & * \\
\bar{C}_i X & B_2 & -X & * \\
\bar{F}_i X & D_2 & 0 & -I
\end{pmatrix} < 0. \tag{31}
\]

As the above matrix inequality contains certain terms $\Psi_{i,k}$ and uncertain ones $\Delta\Psi_{i,k}$, (31) can be transformed as follows:
\[
\Psi_{i,k} + \Delta\Psi_{i,k} < 0, \tag{32}
\]
with
\[
\Psi_{i,k} = \begin{pmatrix}
-\beta X & * & * & * \\
0 & -\gamma^2 I & * & * \\
G_i X & B_2 & -X & * \\
F_i X & D_2 & 0 & -I
\end{pmatrix}, \tag{33}
\]
\[
\Delta\Psi_{i,k} = \begin{pmatrix}
0 & 0 & * & * \\
0 & 0 & 0 & 0 \\
-\mu \bar{B}_{ii} \phi_k M & 0 & 0 & 0 \\
-\mu \bar{D}_{ii} \phi_k M & 0 & 0 & 0
\end{pmatrix}. \tag{34}
\]

We notice that there are antidiagonal terms in $\Delta\Psi_{i,k}$. However, we use the Separation Lemma, as is defined in Appendix C, to transform them into diagonal terms as follows:
\[
\Delta\Psi_{i,k} \leq \begin{pmatrix}
\delta_{12} M^+ M & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & \tau_1 \mu^2 \bar{B}_{ii} \bar{B}_{ii}^+ & 0 \\
0 & 0 & 0 & \tau_2 \mu^2 \bar{D}_{ii} \bar{D}_{ii}^+
\end{pmatrix}, \tag{35}
\]
where $\tau_1$, $\tau_2$, and $\delta_{12} = \tau_1^{-1} + \tau_2^{-1}$ are positive scalars to be assigned.

Referring to relations (33) and (35), we obtain
\[
-\beta X + \delta_{12} M^+ M + \mu \bar{B}_{ii} \phi_k M + \mu \bar{D}_{ii} \phi_k M \leq 0. \tag{36}
\]

After some manipulations, we get the LMI formulation (25).

Remark 1. Consider system (19) with no uncertainty, i.e., $\Delta K = 0$. Then, the origin of the closed-loop system (26) is globally asymptotically stable if [27]

\[
\begin{pmatrix}
-\beta X & * & * & * \\
0 & -\gamma^2 I & * & * \\
G_i X & B_2 & -X + \tau_1 \mu^2 \bar{B}_{ii} \bar{B}_{ii}^+ & * \\
F_i X & D_2 & 0 & -I + \tau_2 \mu^2 \bar{D}_{ii} \bar{D}_{ii}^+
\end{pmatrix} < 0. \tag{37}
\]

In the following, a numerical example is provided to demonstrate the validity and the effectiveness of the proposed control scheme.

4. Application to a TRMS

The objective of this simulation study is to stabilize the controlled TRMS and its identified multivariable...
Hammerstein model at the origin, as an asymptotically stable equilibrium point. More precisely, its system behaviour resembles that of a helicopter, as is seen in Figure 2. It consists of two rotors (main and tail), which are situated on a beam together with a counterbalance. The inputs of the open-loop system are the voltages $u_1 (V)$ and $u_2 (V)$ applied, respectively, to the main and tail rotors. The first output is called pitch angle $\gamma_1 (\text{rad})$ when the main rotor is free to rotate in the horizontal plane. The second output is called yaw angle $\gamma_2 (\text{rad})$ when the tail rotor is free to rotate in the vertical plane.

The studied system is described by the following continuous-time nonlinear equations [43]:

$$\begin{align*}
\dot{x}_1 &= M_1 - M_{FG} - M_{BP} - M_G, \\
\dot{x}_2 &= M_2 - M_{BP} - M_R,
\end{align*}$$

(38)

where $M_1 = a_1 \eta_1^2 + b_1 \eta_1$, $M_{FG} = M_p \sin(\psi)$, $M_{BP} = B_1 \psi$, $M_G = K_{g\phi} M_1 \phi \cos(\psi) - K_{g\phi} \psi^2 \sin(2\psi)$, $M_2 = a_2 \eta_2^2 + b_2 \eta_2$, $M_{BP} = B_1 \psi$, $\dot{\eta}_1 = -T_0/1 + k_1/1 + u_1$, $\dot{\eta}_2 = -T_0/1 + k_2/1 + u_2$, $M_R = k_c \eta_1 + T_0/1 + T_0/1$, and $s$ is the Laplace variable. All parameters are defined in Appendix D.

4.1. Identification Result. From an identification point of view, we assume that the input-output data are available. Then, we consider that the sampling period is $T = 0.1$ s and the inputs are $u_{1,k} = 2.5 \sin(0.6\pi kT)$ and $u_{2,k} = 2 \sin(0.8\pi kT)$. Figures 3 and 4 depict the responses of the true (solid line) and estimated (dashed line) outputs of the open-loop system.

It is then clear that the nonlinear TRMS is accurately identified by 2-input 2-output Hammerstein state-space model, which is described by

$$\begin{align*}
x_{k+1} &= A x_k + B_1 v_k + B_2 u_k, \\
y_k &= C x_k + D v_k + e_k,
\end{align*}$$

(39)

where

$$x_k = \begin{pmatrix} x_{1,k} \\ x_{2,k} \\ x_{3,k} \end{pmatrix},$$

$$v_k = \begin{pmatrix} v_{1,k} \\ v_{2,k} \end{pmatrix},$$

$$y_k = \begin{pmatrix} y_{1,k} \\ y_{2,k} \end{pmatrix},$$

$$w_k \in \mathbb{R}^4, e_k \in \mathbb{R}^2,$$

$$A = \begin{pmatrix} 0.9709 & -0.3380 & 0.1232 & 0.0306 \\ 0.1179 & 0.9745 & 0.0093 & -0.0109 \\ -0.0375 & 0.0087 & 0.9974 & -0.0798 \\ 0.0109 & -0.0226 & 0.0270 & 0.8693 \end{pmatrix},$$

$$B_1 = \begin{pmatrix} 0.0111 & 0.0547 \\ -0.0131 & -0.0027 \\ 0.2172 & 0.3044 \\ 0.0865 & 0.0520 \end{pmatrix},$$

$$B_2 = \begin{pmatrix} -0.2292 & 0.5655 & 7.7293 & 0.2978 \\ 1.4445 & 0.2131 & -5.6435 & 0.0878 \\ -0.4621 & -0.0928 & -2.4361 & 0.1226 \\ -0.2324 & 0.0914 & 9.9696 & -0.7869 \end{pmatrix},$$

$$C = \begin{pmatrix} -0.0853 & 0.2915 & -0.1147 & 0.0093 \\ 0.0121 & -0.1440 & -0.3784 & -0.1127 \end{pmatrix},$$

$$D = \begin{pmatrix} -0.0326 & 0.0063 \\ 0.0284 & -0.0713 \end{pmatrix}.$$

Figure 3: Response of the pitch angle of the open-loop system.

By considering the pairs \((\sigma_1, \sigma_2), (\sigma_1, \sigma_3), (\sigma_1, \sigma_2),\) and \((\sigma_1, \sigma_2),\) we construct the following fuzzy subsystems:

rule 1: if \((v_{1,k} \in H_1^1)\) and \((v_{2,k} \in H_1^1),\)
then \(x_{k+1} = Ax_k + B_{11} \bar{v}_k + B_1 w_k, z_k\)
\[
= C_z x_k + \bar{D}_{11} \bar{v}_k + D_1 w_k,
\]
rule 2: if \((v_{1,k} \in H_1^1)\) and \((v_{2,k} \in H_1^2),\)
then \(x_{k+1} = Ax_k + B_{12} \bar{v}_k + B_2 w_k, z_k\)
\[
= C_z x_k + \bar{D}_{12} \bar{v}_k + D_2 w_k,
\]
rule 3: if \((v_{1,k} \in H_1^2)\) and \((v_{2,k} \in H_1^2),\)
then \(x_{k+1} = Ax_k + B_{13} \bar{v}_k + B_2 w_k, z_k\)
\[
= C_z x_k + \bar{D}_{13} \bar{v}_k + D_2 w_k,
\]
rule 4: if \((v_{1,k} \in H_1^2)\) and \((v_{2,k} \in H_1^2),\)
then \(x_{k+1} = Ax_k + B_{14} \bar{v}_k + B_2 w_k, z_k\)
\[
= C_z x_k + \bar{D}_{14} \bar{v}_k + D_2 w_k,
\]

where

\[
\bar{B}_{11} = \begin{pmatrix} 0.0187 & 0.1094 \\ -0.0223 & -0.0054 \\ 0.3692 & 0.6088 \\ 0.1470 & 0.1040 \end{pmatrix},
\]

\[
\bar{B}_{12} = \begin{pmatrix} -0.0223 & -0.0008 \\ 0.3692 & 0.9013 \\ 0.1470 & 0.0156 \end{pmatrix},
\]

\[
\bar{B}_{13} = \begin{pmatrix} 0.0044 & 0.1094 \\ -0.0052 & -0.0054 \\ 0.0869 & 0.6088 \\ 0.0346 & 0.1040 \end{pmatrix},
\]

\[
\bar{B}_{14} = \begin{pmatrix} 0.0044 & 0.0016 \\ -0.0052 & -0.0008 \\ 0.0869 & 0.9013 \\ 0.0346 & 0.0156 \end{pmatrix},
\]

\[
\bar{D}_{11} = \begin{pmatrix} -0.0554 & 0.0126 \\ 0.0483 & -0.1426 \end{pmatrix},
\]

\[
\bar{D}_{12} = \begin{pmatrix} -0.0554 & 0.0019 \\ 0.0483 & -0.0214 \end{pmatrix},
\]

\[
\bar{D}_{13} = \begin{pmatrix} -0.0130 & 0.0126 \\ 0.0114 & -0.1426 \end{pmatrix},
\]

\[
\bar{D}_{14} = \begin{pmatrix} -0.0130 & 0.0019 \\ 0.0114 & -0.0214 \end{pmatrix}.
\]

As the pairs \((A, B_1),\) for \(i = 1, 2, 3, 4,\) are controllable, the resulting fuzzy system can be described as follows:

\[
x_{k+1} = \sum_{i=1}^{4} h_i(A x_k + B_{1i} \bar{v}_k + B_i w_k),
\]

\[
z_k = \sum_{i=1}^{4} h_i(C_z x_k + \bar{D}_{zi} \bar{v}_k + D_i w_k),
\]

where the nonlinear weighting functions \(h_i = w_i / \sum_{i=1}^{4} w_i\) are depicted in Figure 6.

Using the LMI formulation (25) with \(\mu = 0.85\) and \(\gamma = 0.7,\) we obtain \(a = 0.794, \beta = 0.63,\) and
Figure 5: Evolution of nonlinear functions. Up Polt: \( v_{1,k} = \psi_1(\hat{v}_{1,k}) \). Down Polt: \( v_{2,k} = \psi_2(\hat{v}_{2,k}) \).

Figure 6: Weighting functions for the four fuzzy sets considered.
\[
P = \begin{pmatrix}
-0.2691 & 0.8651 & -0.2691 & 0.1327 \\
0.8651 & 4.7781 & -0.3205 & 0.1191 \\
0.1237 & 0.1191 & 0.4860 & 4.9015 \\
-0.5072 & -0.2251 & 2.3094 & 1.4059 \\
0.5327 & -0.0653 & 1.4641 & -0.4069
\end{pmatrix},
\]
(49)

Hence, by considering the nonfragile control law (21) subject to the uncertainty (22) with \( \phi_k = \begin{pmatrix} 0.5 \sin(\pi k) & 0 \\
0 & 0.5 \cos(\pi k) \end{pmatrix} \), the inferred controlled system can be described as follows:
\[
\begin{aligned}
x_{k+1} &= \sum_{i=1}^{4} h_i(G_i x_k + B_2 u_k), \\
z_k &= \sum_{i=1}^{4} h_i(F_i x_k + D_2 u_k),
\end{aligned}
\]
(50)

where \( G_i = G_i + \Delta G_i, \quad F_i = F_i + \Delta F_i, \quad \Delta G_i = -\mu B_i \phi_k K, \quad \Delta F_i = -\mu D_i \phi_k K \), for \( i \in \{1, 2, 3, 4\} \), and
\[
\begin{aligned}
G_1 &= \begin{pmatrix}
0.9221 & -0.3266 & -0.0802 & 0.0488 \\
0.1095 & 0.9691 & 0.0686 & 0.0182 \\
-0.1745 & 0.1316 & -0.7467 & -0.3512 \\
0.0301 & 0.0173 & -0.4649 & 0.7049 
\end{pmatrix}, \\
G_2 &= \begin{pmatrix}
0.9716 & -0.3327 & 0.0560 & 0.0110 \\
0.1070 & 0.9694 & 0.0619 & 0.0201 \\
0.1011 & 0.0978 & 0.0110 & -0.5618 \\
0.0772 & 0.0115 & -0.3354 & 0.6689 
\end{pmatrix}, \\
G_3 &= \begin{pmatrix}
0.9149 & -0.3299 & -0.0471 & 0.0689 \\
0.1181 & 0.9730 & 0.0293 & -0.0057 \\
-0.3177 & 0.0680 & -0.0946 & 0.0458 \\
-0.0269 & 0.0080 & -0.2052 & 0.8630 
\end{pmatrix}, \\
G_4 &= \begin{pmatrix}
0.9644 & -0.3359 & 0.0890 & 0.0311 \\
0.1157 & 0.9733 & 0.0226 & -0.0039 \\
-0.0421 & 0.0342 & 0.6631 & -0.1648 \\
0.0201 & -0.0138 & -0.0757 & 0.8270 
\end{pmatrix}, \\
F_1 &= \begin{pmatrix}
-0.1201 & 0.2798 & -0.0052 & 0.0923 \\
0.1125 & -0.1425 & -0.2811 & -0.2386 \\
-0.1144 & 0.2791 & 0.0105 & 0.0880 \\
0.0480 & -0.1345 & -0.4586 & -0.1893 
\end{pmatrix}, \\
F_2 &= \begin{pmatrix}
-0.0986 & 0.2894 & -0.1030 & 0.0328 \\
0.0938 & -0.1508 & -0.1959 & -0.1867 \\
-0.0929 & 0.2887 & -0.0874 & 0.0284 \\
0.0293 & -0.1428 & -0.3733 & -0.1374 
\end{pmatrix}.
\]
(51)

Figures 7–10 show the simulation results of applying the designed nonfragile \( H_{\infty} \) controller to the TRMS (dashed line) and its identified Hammerstein model (solid line) with null initial conditions and the exogenous disturbance signal \( w_k = (\text{rand} \ 0 \ \text{rand} \ 0)^\top \), where \((\text{rand})\) is a uniform number with a uniform distribution on the interval \([0, 0.01]\), which is added by \( w_k = -0.15 \) if \( 50 \leq kT \leq 100 \) and 0 otherwise.
The obtained results indicate that the designed robust and nonfragile $H_\infty$ controller shows good results. However, the responses of the pitch and yaw angles of the controlled nonlinear system and its identified Hammerstein model can rapidly achieve the origin despite the presence of external disturbances and uncertainty in the control law.

5. Conclusion

In this paper, a nonfragile $H_\infty$ feedback controller was designed for nonlinear systems described as multivariable Hammerstein model with separate nonlinearities. The parameters of the linear and nonlinear blocks characterizing the multivariable Hammerstein model structure were separately estimated using the MOESP identification algorithm. Unlike the normal control scheme, the inverses of the static nonlinearities were supposed not bijective and approximated by polynomial functions. The T-S fuzzy representation was used to simplify the nonlinear system description and reject the nonlinearity effect in the controller design. Based on the quadratic Lyapunov function and $H_\infty$ criterion, robust $H_\infty$ was then proposed to robustly stabilize the controlled nonlinear system and its identified Hammerstein model and guarantee the attenuation of disturbance effect in spite of controller gain variations. A TRMS was considered to illustrate the validity and the effectiveness of the designed stabilization scheme.

Appendix

A. Calculation of $\beta_{ij}$ Scalars

The calculation of $\beta_{ij}$ scalars are presented for $\nu = 3$. Then, we have

\[
\begin{align*}
v_{i,k} &= f_i(u_{i,k}) = u_{i,k} + \lambda_{12}u_{i,k}^2 + \lambda_{13}u_{i,k}^3, \\
u_{i,k}^{-1} &= f_{i}^{-1}(\tilde{v}_{i,k}) = \beta_{11}\tilde{v}_{i,k} + \beta_{12}\tilde{v}_{i,k}^2 + \beta_{13}\tilde{v}_{i,k}^3 + \text{hot},
\end{align*}
\]

(A.1)

Substituting the above quantities, we get

\[
u_{i,k} = f_{app}^{-1}(\tilde{v}_{i,k}) = \beta_{11}(u_{i,k} + \lambda_{12}u_{i,k}^2 + \lambda_{13}u_{i,k}^3) + \beta_{12}(u_{i,k} + \lambda_{12}u_{i,k}^2 + \lambda_{13}u_{i,k}^3)^2 + \beta_{13}(u_{i,k} + \lambda_{12}u_{i,k}^2 + \lambda_{13}u_{i,k}^3)^3.
\]

(A.2)

Then, we eliminate the powers higher than 3 of $u_{i,k}$. So, we get

\[
u_{i,k} = \beta_{11}u_{i,k} + (\beta_{11} + \beta_{12}\lambda_{12})u_{i,k}^2 + (\beta_{11}\lambda_{13} + 2\beta_{12}\lambda_{12} + \beta_{13}\lambda_{13})u_{i,k}^3 + \text{hot}.
\]

(A.3)

We obtain finally $\beta_{11} = 1$, $\beta_{12} = -\lambda_{12}$, and $\beta_{13} = 2\lambda_{12}^2 - \lambda_{13}$.

B. Schur Complement

For matrices $M$, $L$, and $Q$ with appropriate dimensions, the matrix inequality $\begin{pmatrix} M & * \\ L & Q \end{pmatrix} < 0$ is equal to (i) $Q < 0, M - L^2Q^{-1}L < 0$ and (ii) $M < 0, Q - LM^{-1}L^T < 0$ where $M$ and $Q$ are invertible and symmetric.

C. Separation Lemma

For matrices $A$ and $B$ with appropriate dimensions and positive scalars $r$, one has $A^2 + B^2 + A \leq rA^2 + A + r^{-1}B^2B$.

D. TRMS Parameters

TRMS parameters are shown in Table 1.
