

Supplementary Figure 1B: Heat map visualization of the differentially expressed proteins in plasma samples of MG patients with the combined treatment of routine western medicine and Jia Wei BZYQ decoction (T3) compared with those of patients with routine treatment (T2). Each row represents an individual protein, and each column represents a batch. Green-red heat map values correspond to low-high protein expression. Red represents up-regulation and green represents down-regulation. The gene name (abbreviation) and fold change of the differentially expressed proteins were presented in the T3 vs T2 excel of Additional file 1 in detail.
