#### Abstract

Let $B$ be a strictly real commutative real Banach algebra with the carrier space $\Phi_{B}$. If $A$ is a commutative real Banach algebra, then we give a representation of a ring homomorphism $\rho: A \rightarrow B$, which needs not be linear nor continuous. If $A$ is a commutative complex Banach algebra, then $\rho(A)$ is contained in the radical of $B$.

2000 Mathematics Subject Classification: 46J10.

1. Introduction and results. Ring homomorphisms are mappings between two rings that preserve both addition and multiplication. In particular, we are concerned with ring homomorphisms between two commutative Banach algebras. If $\mathbb{R}$ is the real number field, then the zero map and the identity are typical examples of ring homomorphisms on $\mathbb{R}$. Furthermore, the converse is true: if $\rho$ is a nonzero ring homomorphism on $\mathbb{R}$, then $\rho(t)=t$ for every $t \in \mathbb{R}$. For if $\rho$ is nonzero, then $\rho(1)=\rho(1)^{2}$ implies $\rho(1)=1$, and hence $\rho$ preserves every rational number. Suppose that $a \geq 0$. Then we have $\rho(a)=\rho(\sqrt{a})^{2} \geq 0$. It follows that $\rho$ preserves the order. Fix $t \in \mathbb{R}$ and choose rational sequences $\left\{p_{n}\right\}$ and $\left\{q_{n}\right\}$ converging to $t$ such that $p_{n} \leq t \leq q_{n}$. Since $\rho$ preserves both rational numbers and the order $p_{n} \leq \rho(t) \leq q_{n}$, thus $\rho(t)=t$.

Let $C_{\mathbb{R}}(K)$ be the commutative real Banach algebra of all real-valued continuous functions on a compact Hausdorff space $K$. In the proof of [11, Theorem 3.1], Šemrl essentially gave a representation of a ring homomorphism on $C_{\mathbb{R}}(X)$ into $C_{\mathbb{R}}(Y)$ which states that ring homomorphisms preserve scalar multiplication automatically.

THEOREM 1.1 (Šemrl [11]). If $\rho: C_{\mathbb{R}}(X) \rightarrow C_{\mathbb{R}}(Y)$ is a ring homomorphism, then there exist a closed and open subset $Y_{0} \subset Y$ and a continuous map $\varphi$ : $Y \backslash Y_{0} \rightarrow X$ such that

$$
\rho(f)(y)= \begin{cases}0, & y \in Y_{0}  \tag{1.1}\\ f(\varphi(y)), & y \in Y \backslash Y_{0}\end{cases}
$$

for every $f \in C_{\mathbb{R}}(X)$.

Recall that a commutative real Banach algebra $A$ is said to be strictly real if $\phi(A) \subset \mathbb{R}$ for all $\phi \in \Phi_{A}$ (cf. [4]), where $\Phi_{A}$ denotes the carrier space of $A$. We generalize the above result as follows.

Theorem 1.2. Suppose that $A$ is a commutative real Banach algebra with carrier space $\Phi_{A}$ and that $B$ is a commutative strictly real Banach algebra with carrier space $\Phi_{B}$. If $\rho$ is a ring homomorphism on $A$ into $B$, then there exist a closed subset $\Phi_{0} \subset \Phi_{B}$ and a continuous map $\varphi: \Phi_{B} \backslash \Phi_{0} \rightarrow \Phi_{A}$ such that

$$
\rho(a)^{\prime}(\psi)= \begin{cases}0, & \psi \in \Phi_{0},  \tag{1.2}\\ \hat{a}(\varphi(\psi)), & \psi \in \Phi_{B} \backslash \Phi_{0},\end{cases}
$$

for every $a \in A$, where : denotes the Gelfand transform.
If, in addition, $A$ is unital, then the above $\Phi_{0}$ is closed and open.
Let $C(K)$ be the commutative complex Banach algebra of all complex-valued continuous functions on a compact Hausdorff space $K$. One might expect that a similar result holds for ring homomorphisms on $C(X)$ into $C(Y)$. Unfortunately, this is not the case. Indeed, there exists a nonzero ring homomorphism $\tau$ on $\mathbb{C}$ such that $\tau$ is not the identity nor complex conjugate (cf. [6]); such a map is called nontrivial. More precisely, there exist $2^{c}$ nontrivial ring homomorphisms on $\mathbb{C}$ (cf. [2]), where $\mathfrak{c}$ denotes the cardinal number of the continuum. However, many authors treat ring homomorphisms between two complex Banach algebras (cf. [1, 3, 5, 7, 8, 9, 10, 11, 12]).

On the other hand, it is easy to see that the zero map is the only ring homomorphism on $\mathbb{C}$ into $\mathbb{R}$. This fact can be generalized as follows.

Theorem 1.3. Suppose that $A$ is a commutative complex Banach algebra and that $B$ is a commutative strictly real Banach algebra with carrier space $\Phi_{B}$. If $\rho: A \rightarrow B$ is a ring homomorphism, then $\rho(a)^{\wedge}=0$ for all $a \in A$, or equivalently, $A$ is mapped into the radical of $B$.
2. Proof of results. Suppose that $\mathscr{A}$ is a commutative algebra. We define $\mathscr{A}_{e}=\mathscr{A}$ if $\mathscr{A}$ is unital; otherwise, $\mathscr{A}_{e}$ denotes the commutative algebra adjoining a unit element $e$ to $\mathscr{A}$.

Lemma 2.1. If $\mathscr{A}$ is a commutative algebra over $\mathbb{F} \in\{\mathbb{R}, \mathbb{C}\}$ and if $\phi$ is a nonzero ring homomorphism on $\mathscr{A}$ into $\mathbb{C}$, then $\phi$ can be extended to a unique ring homomorphism $\tilde{\phi}$ on $\mathscr{A}_{e}$ into $\mathbb{C}$.

Proof. Choose $a \in \mathscr{A}$ so that $\phi(a) \neq 0$. If we define $\tilde{\phi}: \mathscr{A}_{e} \rightarrow \mathbb{C}$ by

$$
\begin{equation*}
\tilde{\phi}(f, \lambda) \stackrel{\text { def }}{=} \phi(f)+\frac{\phi(\lambda a)}{\phi(a)}, \quad(f, \lambda) \in \mathscr{A}_{e}, \tag{2.1}
\end{equation*}
$$

it is trivial to verify that $\tilde{\phi}$ is additive. Identifying $f$ with $(f, 0)$, we obtain $\left.\tilde{\phi}\right|_{\mathscr{A}}=\phi$. We show that $\tilde{\phi}$ is multiplicative. For every $v, \lambda, \mu \in \mathbb{F}$ and $h \in \mathscr{A}$,
we have

$$
\begin{equation*}
\phi(v h)=\phi(h) \frac{\phi(v a)}{\phi(a)}, \quad \frac{\phi(\lambda \mu a)}{\phi(a)}=\frac{\phi(\lambda a)}{\phi(a)} \frac{\phi(\mu a)}{\phi(a)} . \tag{2.2}
\end{equation*}
$$

Hence

$$
\begin{align*}
\tilde{\phi}((f, \lambda)(g, \mu)) & =\tilde{\phi}(f g+\mu f+\lambda g, \lambda \mu) \\
& =\phi(f) \phi(g)+\phi(\mu f)+\phi(\lambda g)+\frac{\phi(\lambda \mu a)}{\phi(a)} \\
& =\left\{\phi(f)+\frac{\phi(\lambda a)}{\phi(a)}\right\}\left\{\phi(g)+\frac{\phi(\mu a)}{\phi(a)}\right\}  \tag{2.3}\\
& =\tilde{\phi}(f, \lambda) \tilde{\phi}(g, \mu)
\end{align*}
$$

whenever $(f, \lambda),(g, \mu) \in \mathscr{A}_{e}$, and thus $\tilde{\phi}$ is multiplicative.
We have now proved that there exists an extension $\tilde{\phi}$ of $\phi$ on $\mathcal{A}_{e}$.
It remains to prove that $\tilde{\phi}=\tilde{\phi}^{\prime}$ whenever $\tilde{\phi}^{\prime}$ is a ring homomorphism which extends $\phi$ on $\mathscr{A}_{e}$. So, fix $(f, \lambda) \in \mathscr{A}_{e}$. Since

$$
\begin{equation*}
\phi(\lambda a)=\tilde{\phi}^{\prime}(\lambda a)=\tilde{\phi}^{\prime}(\lambda e) \phi(a) \tag{2.4}
\end{equation*}
$$

it follows that

$$
\begin{equation*}
\tilde{\phi}^{\prime}(f, \lambda)=\tilde{\phi}^{\prime}(f)+\tilde{\phi}^{\prime}(\lambda e)=\phi(f)+\frac{\phi(\lambda a)}{\phi(a)}=\tilde{\phi}(f, \lambda), \tag{2.5}
\end{equation*}
$$

and the uniqueness is proved.
Definition 2.2. Let $A$ be a commutative Banach algebra over $\mathbb{F} \in\{\mathbb{R}, \mathbb{C}\}$ and let $B$ be a commutative real or complex Banach algebra with carrier space $\Phi_{B}$. If $\rho$ is a ring homomorphism on $A$ into $B$, then the formula

$$
\begin{equation*}
\rho_{\psi}(f) \stackrel{\text { def }}{=} \rho(f)^{\prime}(\psi), \quad f \in A, \tag{2.6}
\end{equation*}
$$

assigns to each $\psi \in \Phi_{B}$ a ring homomorphism $\rho_{\psi}: A \rightarrow \mathbb{C}$.
If $\rho_{\psi}$ is nonzero, then there is a unique extension $\widetilde{\rho_{\psi}}$ of $\rho_{\psi}$ on $A_{e}$ (Lemma 2.1). We define a ring homomorphism $\sigma_{\psi}: \mathbb{F} \rightarrow \mathbb{C}$ by

$$
\begin{equation*}
\sigma_{\psi}(\lambda)=\widetilde{\rho_{\psi}}(\lambda e), \quad \lambda \in \mathbb{F} . \tag{2.7}
\end{equation*}
$$

It follows from this definition that

$$
\begin{equation*}
\rho_{\psi}(\lambda f)=\widetilde{\rho_{\psi}}(\lambda f)=\widetilde{\rho_{\psi}}(\lambda e) \widetilde{\rho_{\psi}}(f)=\sigma_{\psi}(\lambda) \rho_{\psi}(f) \tag{2.8}
\end{equation*}
$$

whenever $\rho_{\psi}$ is nonzero, $\lambda \in \mathbb{F}$, and $f \in A$.

Proof of Theorem 1.2. Put $\Phi_{0} \stackrel{\text { def }}{=}\left\{\psi \in \Phi_{B}: \operatorname{ker} \rho_{\psi}=A\right\}$ (possibly empty), and let $\left\{\psi_{\alpha}\right\} \subset \Phi_{0}$ be a net converging to $\psi_{0} \in \Phi_{B}$. Fix $a \in A$. Since $\rho(a)^{\prime}$ is a continuous function on $\Phi_{B}$, then $0=\rho(a)^{\gamma}\left(\psi_{\alpha}\right) \rightarrow \rho(a)^{\wedge}\left(\psi_{0}\right)$. Since $a$ was arbitrary, it follows that $\psi_{0} \in \Phi_{0}$, and hence, $\Phi_{0}$ is a closed subset of $\Phi_{B}$. Moreover, if $A$ has a unit $e$, then $\rho_{\psi}(e)=0$ or 1 , and hence,

$$
\begin{equation*}
\Phi_{0}=\left\{\psi \in \Phi_{B}: \rho_{\psi}(e)=0\right\}=\left\{\psi \in \Phi_{B}: \rho_{\psi}(e)<2^{-1}\right\} . \tag{2.9}
\end{equation*}
$$

It follows that $\Phi_{0}$ is closed and open whenever $A$ is unital.
Pick $\psi \in \Phi_{B} \backslash \Phi_{0}$. Since $B$ is strictly real, the map $\sigma_{\psi}$ as in Definition 2.2 is a nonzero ring homomorphism on $\mathbb{R}$ into $\mathbb{R}$ so that $\sigma_{\psi}$ is the identity map on $\mathbb{R}$. It follows from (2.8) that

$$
\begin{equation*}
\rho_{\psi}(t a)=\sigma_{\psi}(t) \rho_{\psi}(a)=t \rho_{\psi}(a), \quad t \in \mathbb{R}, a \in A \tag{2.10}
\end{equation*}
$$

proving that $\rho_{\psi} \in \Phi_{A}$ for every $\psi \in \Phi_{B} \backslash \Phi_{0}$. Let $\varphi: \Phi_{B} \backslash \Phi_{0} \rightarrow \Phi_{A}$ be the map defined by $\varphi(\psi) \stackrel{\text { def }}{=} \rho_{\psi}$. Then we have (1.2) for every $a \in A$. Finally, we show the continuity of $\varphi$. Suppose that $\left\{\psi_{\beta}\right\} \subset \Phi_{B} \backslash \Phi_{0}$ is a net converging to $\psi_{1} \in \Phi_{B} \backslash \Phi_{0}$. Then (1.2) gives

$$
\begin{equation*}
\hat{a}\left(\varphi\left(\psi_{\beta}\right)\right)=\rho(a)\left(\psi_{\beta}\right) \rightarrow \rho(a)\left(\psi_{1}\right)=\hat{a}\left(\varphi\left(\psi_{1}\right)\right) \tag{2.11}
\end{equation*}
$$

for every $a \in A$. Hence $\varphi\left(\psi_{\beta}\right)$ converges to $\varphi\left(\psi_{1}\right)$. This implies that $\varphi$ is continuous on $\Phi_{B} \backslash \Phi_{0}$.

Proof of Theorem 1.3. Pick $a \in A$ and $\psi \in \Phi_{B}$. If $\rho(a)^{\prime}(\psi) \neq 0$, then $\sigma_{\psi}(i)= \pm i$, and hence, $\rho(i a)^{\gamma}(\psi)$ would be a nonzero pure imaginary number by (2.8), in contradiction to $B$ being strictly real.
