In this article, we establish an extension of the bivariate generalization of the $q$-Bernstein type operators involving parameter $\lambda$ and extension of GBS (Generalized Boolean Sum) operators of bivariate $q$-Bernstein type. For the first operators, we state the Vol’kovev-type theorem and we obtain a Voronovskaja type and investigate the degree of approximation by means of the Lipschitz type space. The comparison of convergence of the bivariate $q$-Bernstein type operators based on parameters and its GBS type operators is shown by illustrative graphics using MATLAB software.

1. Introduction

Let $h \in C(S)$ with $S = [0, 1], \lambda \in [-1, 1]$, and $m \in \mathbb{N}$. In 2018, Chen et al. [1] proposed a new generalization of Bernstein operators based on a fixed real parameter $\lambda \in [-1, 1]$ as

$$\mathcal{B}_m^\lambda(h; y) = \sum_{k=0}^{m} \Omega_{m,k}^{(\lambda)}(y) h\left(\frac{k}{m}\right), \quad x \in S, \quad (1)$$

where the basis functions $\Omega_{m,k}^{(\lambda)}(y)$ are defined as

$$\Omega_{m,0}^{(\lambda)}(y) = \Omega_{m,0}(y) - \frac{\lambda}{m+1} \Omega_{m+1,1}(y),$$

$$\Omega_{m,k}^{(\lambda)}(y) = \Omega_{m,k}(y) + \lambda \left(\frac{m-2j+1}{m^2-1} \Omega_{m+1,k}(y) - \frac{m-2j-1}{m^2-1} \Omega_{m+1,k+1}(y)\right),$$

$$1 \leq k \leq m-1,$$

$$\Omega_{m,m}^{(\lambda)}(y) = \Omega_{m,m}(y) - \frac{\lambda}{m+1} \Omega_{m+1,m}(y),$$

$$\quad (2)$$

The authors studied the established of some Korovkin type approximation properties and the degree of approximation by means of the modulus of continuity, Voronovskaja-type results, and shape-preserving properties for these operators.

This work took the attention of researchers from approximation theory for a short time. Since that time, lots of researchers have put forth many relevant studies on this issue, and numerous articles can be given interrelated with their work [2–5].

In [6] were introduced the bivariate extension of the operators (1) and studied the degree of approximation in terms of the second order Ditzian-Totik modulus of continuity for two variables. A Kantorovich variant of the $\lambda$-Bernstein operators (1) was introduced and studied in [7]. Many authors also considered the univariate and bivariate positive linear operators and studied their approximation behavior; we refer the reader to articles (cf. [8–17]) and references therein. Now, we give some basic definitions based on the $q$-calculus [18], which are used in this paper. Let $0 < q < 1$ and $b, x$ be any real numbers.

The $q$-number $[b]_q$ is defined as $[b]_q = \{1 - q^{b}/1 - q, q \neq 1\}$ and for $b = n \in \mathbb{N}$,

$$[n]_q = 1 + q + \cdots + q^{n-1}. \quad (3)$$
The $q$-number $(1 - x)^q$ is defined as $(1 - x)^q = \prod_{i=0}^{q-1} (1 - xq^i)$ and for $b = n \in \mathbb{N}$

$$(1 - x)^q = (1 - x)(1 - qx) \cdots (1 - q^{n-1}x).$$

For the integers $n, j$ such that $0 \leq j \leq n$, the $q$-binomial is defined as

$$\binom{m}{j}_q = \frac{[n]_q!}{[j]_q! [n - j]_q!}.$$  

For an integer $n$, the $q$-factorial is defined as

$$[n]_q! = [n]_q [n - 1]_q \cdots [1]_q$$

and $[n]_q! = 1$ if $n = 0$.

Cai et al. [19] considered the generalized Bernstein type operators based on parameters $q$ - analogue and for fixed real parameter $\lambda \in [-1, 1]$ as

$$\mathcal{B}_m(h; q, y) = \sum_{j=0}^{m} \Omega_{m,j}^{(q,\lambda)}(y) h \left( \frac{[j]_q}{[m]_q} \right), \quad y \in S,$$

where the basis functions $\Omega_{m,j}^{(q,\lambda)}(y)$ are defined as

$$\Omega_{m,0}^{(q,\lambda)}(y) = \mathcal{B}_m^q(h; y, q),$$

$$\Omega_{m,j}^{(q,\lambda)}(y) = \mathcal{B}_m^q(h; y, q) \lambda \left( \frac{[m]_q - 2[j]_q + 1}{[m]_q^2 - 1} \right) \Omega_{m+1,j}(y)$$

$$- \frac{[m]_q - 2[j]_q + 1}{[m]_q^2 - 1} \mathcal{B}_m^{q+1}(h; y, q) \Omega_{m+1,j+1}(y),$$

and $\Omega_{m,j}^{(q,\lambda)}(y) = \binom{m}{j}_q y^j \prod_{i=0}^{m-j-1} (1 - q^i y)$. Note that for $q = 1$, these operators reduce to $\lambda$-Bernstein operators (1) and for $q = \lambda = 1$ (7) reduces to Bernstein operators defined in [20].

Therefore, linear operators, in particular the limit $q$-Bernstein operator, are of significant interest for applications.

The purpose of this article is to present an extension of the bivariate $\lambda, q$-Bernstein type operators involving parameters and obtain the degree of approximation by means of the Lipschitz type space for two variables. Moreover, we consider the associated Generalized Boolean Sum (GBS) operators and study their degree of approximation in terms of the mixed modulus of smoothness for bivariate functions.

2. Construction of the Bivariate $q_1, \lambda$-Bernstein Type Operators

For $S^2 = [0, 1] \times [0, 1]$, let $C(S^2)$ be the space of all continuous functions on $S^2$.

For $h \in C(S^2)$ and $\lambda_1, \lambda_2 \in [-1, 1]$, the bivariate extension of the operator (7) is defined by

$$\mathcal{B}_{m_1,m_2}(h; y_1, y_2) = \sum_{j_1=0}^{m_1} \sum_{j_2=0}^{m_2} \Omega_{m_1,j_1,m_2,j_2}^{(\lambda_1,\lambda_2)}(y_1, y_2) h \left( \frac{[j_1]_q}{[m_1]_q}, \frac{[j_2]_q}{[m_2]_q} \right),$$

where $\{ q_m \}_{m \in \mathbb{N}}$ is a sequence in $(0, 1)$ satisfying

$$q_m \to 1 \quad \text{and} \quad q_m^m \to c; \text{for } i = 1, 2.$$

Further, $\Omega_{m_1,j_1}^{(\lambda_1)}(y_1, y_2) = \Omega_{m_1,j_1}^{(\lambda_1)}(y_1) \Omega_{m_2,j_2}^{(\lambda_2)}(y_2)$, where $\Omega_{m_1,j_1}^{(\lambda_1)}(y_1)$ and $\Omega_{m_2,j_2}^{(\lambda_2)}(y_2)$ are defined similarly as $\mathcal{B}_m(h; y)$ in (8).

It is easy to see that $\mathcal{B}_{m_1,m_2}(h; y_1, y_2)$ is bounded. We denote

$$\mathcal{B}_{m_1,m_2}(h; q_1, q_2, y),$$

and $\mathcal{B}_{m_1}^{(q_1)}(h; q_1, q_2, y_1)$. Note that for $q = 1$, these operators reduce to $\lambda$-Bernstein operators (1) and for $q = \lambda = 1$ (7) reduces to Bernstein operators defined in [20].

Therefore, linear operators, in particular the limit $q$-Bernstein operator, are of significant interest for applications.

**Lemma 1** (see [19]). For the operators $\mathcal{B}_m(h; q, y)$, we have

(i) $\mathcal{B}_m^q(1; q_1, q_2, y) = 1$

(ii) $\mathcal{B}_m^{(q_1, \lambda)}(t; q_1, q_2, y_1) = y_1 + ([m_1 + 1]_{q_1} y_1 (1 - y_1^{m_1}))(\lambda_1/[m_1]_{q_1})$

(iii) $\mathcal{B}_m^{(q_1, \lambda)}(t; q_1, q_2, y_1) = y_1 + (y_1 (1 - y_1^{m_1})) + (\lambda_1/[m_1]_{q_1})$

(iv) $\mathcal{B}_m^{(q_1, \lambda)}(t; q_1, q_2, y_1) = y_1 + (y_1 (1 - y_1^{m_1})) + (\lambda_1/[m_1]_{q_1})$

(v) $\mathcal{B}_m^{(q_1, \lambda)}(t; q_1, q_2, y_1) = y_1 + (y_1 (1 - y_1^{m_1})) + (\lambda_1/[m_1]_{q_1})$

(vi) $\mathcal{B}_m^{(q_1, \lambda)}(t; q_1, q_2, y_1) = y_1 + (y_1 (1 - y_1^{m_1})) + (\lambda_1/[m_1]_{q_1})$

(vii) $\mathcal{B}_m^{(q_1, \lambda)}(t; q_1, q_2, y_1) = y_1 + (y_1 (1 - y_1^{m_1})) + (\lambda_1/[m_1]_{q_1})$

(viii) $\mathcal{B}_m^{(q_1, \lambda)}(t; q_1, q_2, y_1) = y_1 + (y_1 (1 - y_1^{m_1})) + (\lambda_1/[m_1]_{q_1})$

(ix) $\mathcal{B}_m^{(q_1, \lambda)}(t; q_1, q_2, y_1) = y_1 + (y_1 (1 - y_1^{m_1})) + (\lambda_1/[m_1]_{q_1})$
In order to obtain the main results, we need the following lemmas:

**Lemma 2.** For the operators \( \mathcal{B}_{m_1, m_2} \), we have

(i) \( \mathcal{B}_{m_1, m_2}^{\lambda_1, \lambda_2} (1; y_1, y_2) = 1 \)

(ii) \( \mathcal{B}_{m_1, m_2}^{\lambda_1, \lambda_2} (e_0; y_1, y_2) = y_2^2 + (y_1(1 - y_1)/m_1) y_1^{m_1-1} y_2^{m_2-1} - (2 y_1(m_1 + 1)/q_1) y_2 y_1^{m_1-2} y_2^{m_2-2} - (2 y_1(m_1 + 1)/q_1) y_2 y_1^{m_1-2} y_2^{m_2-2} - (2 y_1(m_1 + 1)/q_1) y_2 y_1^{m_1-2} y_2^{m_2-2} + \cdots \)

(iii) \( \mathcal{B}_{m_1, m_2}^{\lambda_1, \lambda_2} (e_0; y_1, y_2) = y_2^2 + (y_1(1 - y_1)/m_1) y_1^{m_1-1} y_2^{m_2-1} - (2 y_1(m_1 + 1)/q_1) y_2 y_1^{m_1-2} y_2^{m_2-2} - (2 y_1(m_1 + 1)/q_1) y_2 y_1^{m_1-2} y_2^{m_2-2} - (2 y_1(m_1 + 1)/q_1) y_2 y_1^{m_1-2} y_2^{m_2-2} + \cdots \)

Corollary 3. Applying Lemma 2, we have

(i) \( \mathcal{B}_{m_1, m_2}^{\lambda_1, \lambda_2} (u - y_1; y_1, y_2) = [m_1 + 1] y_1 y_2^2 - y_1^{m_1-1} y_2^{m_2-1} - y_1^{m_1-2} y_2^{m_2-2} - y_1^{m_1-2} y_2^{m_2-2} + \cdots \)

(ii) \( \mathcal{B}_{m_1, m_2}^{\lambda_1, \lambda_2} (v - y_2; y_1, y_2) = [m_1 + 1] y_1 y_2^2 - y_1^{m_1-1} y_2^{m_2-1} - y_1^{m_1-2} y_2^{m_2-2} - y_1^{m_1-2} y_2^{m_2-2} + \cdots \)

(iii) \( \mathcal{B}_{m_1, m_2}^{\lambda_1, \lambda_2} (u - y_1^2; y_1, y_2) = [m_1 + 1] y_1 y_2^2 - y_1^{m_1-1} y_2^{m_2-1} - y_1^{m_1-2} y_2^{m_2-2} - y_1^{m_1-2} y_2^{m_2-2} + \cdots \)
In order to discuss the next results, let us recall the definitions of modulus of continuity and partial modulus of continuity

**Definition 5** (see [22]). For $h \in S^2$ and $\delta > 0$, the full modulus of continuity in the bi-variate case is defined as

$$\omega(h; \delta) = \max_{(t_1, t_2) \in [0, 1]^2} \{ |h(t_1, t_2) - h(y_1, y_2)| : (t_1, t_2), (y_1, y_2) \in S^2 \}.$$  

(17)

For each fixed $i = 1, 2$, the partial modulus of continuity of $h$ with respect to $y_i$ is defined

$$\omega_i(h; \delta) = \sup \{ |h(x, y_i) - h(x, y_i')| : y_i' \in [0, 1], |y_i - y_i'| \leq \delta \},$$

(18)

and

$$\omega_2(h; \delta) = \sup \{ |h(x, y_2) - h(x, y_2')| : x \in [0, 1], |y_2 - y_2'| \leq \delta \},$$

(19)

respectively.

**Theorem 6.** For $h \in C(S^2)$, we have

$$\|B_{n, m_{1, 2}}^{(i_1, i_2)}(h) - h\| \leq 2\omega_i(h; \delta),$$

(20)

where $\delta^2 = \mu_{m_{1, 2}}(q_{m_1}, y_1; q_{m_2}, y_2) + \mu_{m_{2, 1}}(q_{m_2}, y_2; q_{m_1}, y_1)$.

**Proof.** Using the facts that

$$|B_{n, m_{1, 2}}^{(i_1, i_2)}(h(t_1, t_2); y_1, y_2) - h(y_1, y_2)| \leq \sum_{i=0}^{m_1} \sum_{j=0}^{m_2} \Omega_{n, m_{1, 2}}^{(i_1, i_2)}(y_1, y_2) \left| \frac{[i_1]}{m_1} \right| \left| \frac{[i_2]}{m_2} \right| - h(y_1, y_2).$$

(21)

Then, we use the following property of the complete modulus of continuity:

$$|h(t_1, t_2) - h(y_1, y_2)| \leq \omega^{(i)}(f; \delta) \left( 1 + \frac{\sqrt{(t_1 - y_1)^2 + (t_2 - y_2)^2}}{\delta} \right),$$

(22)

we get

$$|B_{n, m_{1, 2}}^{(i_1, i_2)}(h(t_1, t_2); y_1, y_2) - h(y_1, y_2)| \leq \frac{\sqrt{(t_1 - y_1)^2 + (t_2 - y_2)^2}}{\delta} \omega^{(i)}(h; \delta).$$

(23)
Applying Cauchy Schwarz inequality, we have
\[
\left| \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (h(t_1, t_2); y_1, y_2) - h(y_1, y_2) \right|
\leq \left[ \frac{1}{\delta} \left( \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} ((t-x)^2; y_1, y_2) + \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} ((s-y)^2; y_1, y_2) \right)^{1/2} \left( \omega_1; h; \delta \right) \right]
\leq \left[ 1 + \frac{1}{\delta} \left( \mu_{m,1,2}(q_{m,1}; y_1) + \mu_{m,1,2}(q_{m,2}; y_2) \right) \right]^{1/2} \omega_1(h; \delta; \forall y_1, y_2) \in S^2.
\] (24)

By choosing
\[
\delta = \left( \mu_{m,1,2}(q_{m,1}; y_1) + \mu_{m,1,2}(q_{m,2}; y_2) \right)^{1/2},
\] (25)
we obtain the desired result.

**Theorem 7.** Let \( h \in C(S^2) \), then the following inequality holds:
\[
\left| \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (h(t_1, t_2); y_1, y_2) - h(y_1, y_2) \right|
\leq 2 \left\{ \omega_1(h; \mu_{m,1,2}(q_{m,1}; y_1)) + \omega_1(h; \mu_{m,1,2}(q_{m,2}; y_2)) \right\}.
\] (26)

**Proof.** Similarly to previous theorems, using relations (19) we obtain
\[
\left| \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (h(t_1, t_2); y_1, y_2) - h(y_1, y_2) \right|
\leq \left\{ \omega_2(h; \mu_{m,1,2}(q_{m,1}; y_1); y_1, y_2) + \omega_2(h; \mu_{m,1,2}(q_{m,2}; y_2); y_1, y_2) \right\}.
\] (27)

Applying Cauchy Schwarz inequality with \( \delta_1 = (\mu_{m,1,2}(q_{m,1}; y_1))^{1/2} \) and \( \delta_2 = (\mu_{m,1,2}(q_{m,2}; y_2))^{1/2} \), we obtain the desired result.

Now, we want to give the quantitative result in terms of the Lipschitz class functionals. For any functions \( h : S^2 \rightarrow \mathbb{R} \) and \( 0 < u \leq 1 \), the function \( h \) is said to be in Lipschitz class \( L_{m,u}(S^2) \) if \( \exists a M > 0 \) such that
\[
L_{m,u}(h) = \{ h : |h(s_1, s_2) - h(y_1, y_2)| \leq M \| s - t \|_{L^1} \},
\] (28)

where \( s = (s_1, s_2), t = (y_1, y_2) \in S^2 \), where \( \| s - t \| = (\| s_1 - y_1 \|^2 + \| s_2 - y_2 \|^2)^{1/2} \) is the Euclidean norm and \( M \) is a positive real constant.

The following theorem yields us an estimate of error for functions in \( L_{m,u}(S^2) \), by the operators \( \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} \).

**Theorem 8.** Let \( h \in Lip_{m,u}(S^2) \). Then for sufficiently large \( m \) and \( n \) and for all \( y_1, y_2 \in S^2 \), there holds the inequality
\[
\left\| \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (h) - h \right\|_{C(S^2)} \leq M \left\{ (n)^{-1} + (n)^{-1} \right\},
\] (29)

where \( M > 0 \) is a constant.

**Proof.** From hypothesis, we have
\[
\left| \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (h; y_1, y_2) - h(y_1, y_2) \right|
\leq \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (|h(s_1, s_2) - h(y_1, y_2)|; y_1, y_2)
\leq M \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (\| s - t \|; y_1, y_2),
\] (30)

where \( s = (s_1, s_2), t = (y_1, y_2) \in S^2 \). Applying Hölder’s inequality and Corollary 3, we obtain
\[
\left| \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (h; y_1, y_2) - h(y_1, y_2) \right|
\leq M \left( \mu_{m,1,2}(q_{m,1}; y_1) + \mu_{m,1,2}(q_{m,2}; y_2) \right)^{1/2},
\] (31)

which leads to the required result on applying Corollary 3.

Let \( C(S^2) \) denote the space of continuous functions \( h(y_1, y_2) \) on \( S^2 \) whose first-order partial derivatives \( g_{y_1} \) and \( g_{y_2} \) are also continuous on \( S^2 \).

Our next result yields us the rate of approximation for continuously differentiable functions on \( S^2 \) by the operators \( \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} \).

**Theorem 9.** Let \( h \in C(S^2) \). Then for sufficiently large \( m \) and \( n \), we have
\[
\left\| \mathcal{B}_{m,m-2}^{\lambda_1,\lambda_2} (h) - h \right\|_{C(S^2)} \leq A \left( \| h'_{y_1} \|_{C(S^2)} \right)^{1/2} + \| h'_{y_2} \|_{C(S^2)} \right)^{1/2},
\] (32)

where \( A \) is some positive constant.

**Proof.** For \( y_1, y_2 \in S^2 \) be arbitrary, we may write
\[
h(t_1, t_2) - h(y_1, y_2) = \int_{y_1}^{t_1} h'_{y_1}(\eta, t_2) d\eta
+ \int_{y_2}^{t_2} h'_{y_2}(y_1, \phi) d\phi, \text{ for } (t_1, t_2) \in S^2.
\] (33)
Hence, applying the operator $\mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}$ on both sides of the above equation, we obtain

$$
\mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2) - h(y_1, y_2)
= \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( \int_{y_1}^{t_1} h'_{\eta}(\eta, t_2) d\eta ; y_1, y_2 \right)
+ \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( \int_{y_2}^{t_2} h'_{\phi}(y, \phi) d\phi ; y_1, y_2 \right).
$$

(34)

By using sup-norm on $S^2$

$$
\left| \int_{y_1}^{t_1} h'_{\eta}(\eta, t_2) d\eta \right| \leq \left| \int_{y_1}^{t_1} h'_{\eta}(\eta, t) d\eta \right| |t_1 - t|^{1/2}
\leq \left| \int_{t_2 - y_2}^{t_2} h'_{\phi}(y, \phi) d\phi \right| |t_2 - y_2|^{1/2}
\leq \left| \left( \int_{t_2 - y_2}^{y_1} h'_{\phi}(y, \phi) d\phi \right) \right| |t_2 - y_2|^{1/2},
$$

(35)

we get

$$
\left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2) - h(y_1, y_2) \right|
\leq \left| h'_{y_1} \right| \left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_1 - y_1) ; y_1, y_2 \right) \right|
+ \left| h'_{y_2} \right| \left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_2 - y_2) ; y_1, y_2 \right) \right|
$$

(36)

Hence, applying the Cauchy-Schwarz inequality and Corollary 3, we obtain

$$
\left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2) - h(y_1, y_2) \right|
\leq \left| h'_{y_1} \right| \left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t - y) ; y_1, y_2 \right) \right|^{1/2}
+ \left| h'_{y_2} \right| \left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_2 - y_2) ; y_1, y_2 \right) \right|^{1/2},
$$

(37)

from which the desired result is immediate.

The following result yields the degree of approximation of $h$ by $\mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}$, in terms of the partial modul of continuity of the partial derivatives of $h$.

**Theorem 10.** Let $h \in C'(S^2)$. Then for sufficiently large $m$ and $n$, we have

$$
\left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h) - h \right| \leq A \sum_{i=1}^{2} \left| m_{i} \right|^{2} \left\{ 1 + 2 \omega^{(i)}(h'_{y_i}; [m_1]_{\delta_2}) \right\},
$$

(38)

where $\omega^{(i)}(h'_{y_i}; .)$ are the partial modul of continuity of $h'_{y_i}$ for $i = 1, 2$ and $A$ is some positive constant.

**Proof.** If we use the mean value theorem in the following form, we have

$$
\left( t_1 - y_1 \right) h'_{y_1}(\eta, y_2) + \left( t_2 - y_2 \right) h'_{y_2}(y_1, u)
\leq \left( t_1 - y_1 \right) h'_{y_1}(\eta, y_2) + \left( t_2 - y_2 \right) h'_{y_2}(y_1, u)
\leq \left( t_2 - y_2 \right) h'_{y_2}(y_1, u) - h'_{y_2}(y_1, y_2),
$$

(39)

where $y_1 < \eta < t_1$ and $y_2 < u < t_2$. Applying the operator $\mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}$ to both sides, we deduce that

$$
\mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2) - h(y_1, y_2)
= \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2) + \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2)
$$

$$
+ \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2)
$$

$$
+ \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2),
$$

(40)

Since $h'_{y_1}$ and $h'_{y_2}$ are continuous in $S^2$, there exist positive constants $A_1$ and $A_2$ such that $|h'_{y_1}| \leq A_1$ and $|h'_{y_2}| \leq A_2$, for all $(y_1, y_2) \in S^2$. Hence, applying the Cauchy-Schwarz inequality, we obtain

$$
\left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta}(h ; y_1, y_2) - h(y_1, y_2) \right|
\leq \sum_{i=1}^{2} \left| h'_{y_i} \right| \left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_1 - y_1) ; y_1, y_2 \right) \right|
+ \sum_{i=1}^{2} \left| h'_{y_i} \right| \left| \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_2 - y_2) ; y_1, y_2 \right) \right|
\leq \sum_{i=1}^{2} \left| h'_{y_i} \right| \left| \left( \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_1 - y_1) ; y_1, y_2 \right) \right) \right|
+ \sum_{i=1}^{2} \left| h'_{y_i} \right| \left| \left( \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_2 - y_2) ; y_1, y_2 \right) \right) \right|
\leq \sum_{i=1}^{2} \left| h'_{y_i} \right| \left| \left( \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_1 - y_1) ; y_1, y_2 \right) \right) \right|
+ \sum_{i=1}^{2} \left| h'_{y_i} \right| \left| \left( \mathcal{B}_{m,m_2}^{{\lambda_1,\lambda_2,}\eta} \left( (t_2 - y_2) ; y_1, y_2 \right) \right) \right|
$$

(41)

Choosing $\delta_i = ([m_1]_{\delta_2})^{-1/2}$, $i = 1, 2$ we get the required result.
3. Construction of GBS Operator of Generalized Bernstein Type

In the last two decades, the study of generalized Boolean sum (GBS) operators of certain linear positive operators has attracted very much attention in the approximation theory. In early 1937 with Bögel [23], a great number of studies are performed related to these operators. To make an analysis in multidimensional spaces, Bögel [23] introduced the concepts of continuity and differentiability in a Bögel space. There are still many authors working on this subject. Agrawal et al. [24] studied the degree of approximation for bivariate in multidimensional spaces, Bögel [23] introduced the construction of GBS operator of certain linear positive operators has bounded on 

Lupaş et al. [24] studied the degree of approximation for bivariate in multidimensional spaces, Bögel [23] introduced the construction of GBS operator of certain linear positive operators has bounded on 

S, (see [23]). The function \( h : S^2 \rightarrow \mathbb{R} \) is B-bounded on \( S^2 \) if there exists \( M > 0 \) such that \( |\Delta(y_1, y_2) h[t_1, t_2 ; y_1, y_2]| \leq M \) for every \( (y_1, y_2), (t_1, t_2) \in S^2 \).

Throughout this article, \( B \) denotes all B-bounded functions on \( S^2 \). The space of all B-bounded functions is denoted by \( C^B(S^2) \).

Motivated by the above authors, we construct the GBS operator of \( \mathcal{B}^{(\lambda_1, \lambda_2)}_{m_1, m_2} \), who is defined as follows:

\[
\mathcal{B}^{(\lambda_1, \lambda_2)}_{m_1, m_2}(h(t_1, t_2 ; x, y)) \subset B \mathcal{B}^{(\lambda_1, \lambda_2)}_{m_1, m_2}(h(t_1, t_2 ; y_1, y_2)) + h(y_1, y_2) - h(t_1, t_2 ; y_1, y_2), 
\]

for all \( (y_1, y_2) \in S^2 \). More precisely, the \( q \)-analogue \( \lambda \)-Bernstein type GBS operator is defined as follows:

\[
\mathcal{B}^{(\lambda_1, \lambda_2)}_{m_1, m_2}(h(t_1, t_2 ; y_1, y_2)) = \sum_{j_1}^m \sum_{j_2}^m \mathcal{B}^{(\lambda_1, \lambda_2)}_{j_1, j_2}(y_1, y_2) 
\]

\[
\times \left[h \left( \frac{j_1}{m_1}, y_1 \right) + h \left( \frac{j_2}{m_2}, y_2 \right) - h \left( \frac{j_1}{m_1}, \frac{j_2}{m_2} \right) \right], 
\]

where the operator \( \mathcal{B}^{(\lambda_1, \lambda_2)}_{m_1, m_2} \) is well-defined on the space \( C^B(S^2) \) into \( C(S^2) \) and \( h \in C^B(S^2) \).

4. Degree of Approximation by \( \mathcal{B} \mathcal{S}^{(\lambda_1, \lambda_2)}_{m_1, m_2} \)

For \( (y_1, y_2), (t_1, t_2) \in S^2 \), the mixed modulus of smoothness of \( h \in C^p(S^2) \) is defined by

\[
\omega_p(h ; \delta_1, \delta_2) = \sup \left\{ |\Delta(y_1, y_2) h[t_1, t_2 ; y_1, y_2]| : |y_1 - t_1| < \delta_1, |y_2 - t_2| < \delta_2 \right\},
\]

and for any \( (\delta_1, \delta_2) \in (0, \infty) \times (0, \infty) \). Using (45), we have

\[
\omega_p(h ; P_1 \delta_1, P_2 \delta_2) \leq (1 + P_1)(1 + P_2) \omega_p(f ; \delta_1, \delta_2) ; P_1, P_2 > 0,
\]

The basic results of \( \omega_p \) were studied by Badea et al. [27, 28] and are similar to the properties of the usual modulus of continuity for bivariate functions. We shall obtain the rate of approximation of the operators (44) to \( h \in C^p(S^2) \) in terms of the mixed modulus of continuity for two variables. For this, we apply the Shisha-Mond theorem for \( B \)-continuous functions defined by Gonska [29] and Badea and Cottin [28].

Theorem 11. For every \( h \in C^p(S^2) \), at each point \( (y_1, y_2) \in S^2 \) and sufficiently large \( m \) and \( n \), the operator (44) satisfy the following results

\[
\left\| \mathcal{B} \mathcal{S}^{(\lambda_1, \lambda_2)}_{m_1, m_2}(h) - h \right\|_B \leq C_{\lambda_1} \omega_p(h \left[ m_1^{-1/2}, m_2^{-1/2} \right]),
\]

where \( C_{\lambda_1} \) is a positive constant depending on parameters \( \lambda_1 \) and \( \lambda_2 \).

Proof. Using (45) and applying the inequality (46), we have

\[
|\Delta(y_1, y_2) h[t_1, t_2 ; y_1, y_2]| \leq \omega_p(h ; |t_1 - y_1|, |t_2 - y_2|) \leq \prod_{r=1}^{2} \left( 1 + \frac{|t_r - y_r|}{\delta_r} \right) \omega_p(g ; \delta_1, \delta_2) \leq \left( 1 + |t_1 - y_1| \delta_1^{-1} + |t_2 - y_2| \delta_2^{-1} \right. \\
\left. + (\delta_1 \delta_2)^{-1}(|t_1 - y_1| |t_2 - y_2|) \right) \omega_p(h \left[ m_1^{-1/2}, m_2^{-1/2} \right]),
\]

for every \( (y_1, y_2), (t_1, t_2) \in S^2 \) and for any \( \delta_1, \delta_2 > 0 \). Taking the definition of \( \Delta(y_1, y_2) h[t_1, t_2 ; y_1, y_2] \), we may write

\[
h(y_1, t_2) + h(t_1, y_2) - h(t_1, t_2) = h(y_1, y_2) - \Delta(y_1, y_2) h[t_1, t_2 ; y_1, y_2].
\]
Function \( h(y_1, y_2) = 2^x y_1^3 \sin(2^x y_1^2)^x y_2 \)

B Operator: \( m_1 = 10, m_2 = 10 \)

GBS Bernstein Operator: \( m_1 = 10, m_2 = 10 \)

GBS Bernstein Operator: \( m_1 = 30, m_2 = 30 \)

**Figure 1:** The convergence of \( \mathcal{B}_{m_1, m_2}^{\lambda_1, \lambda_2} (h; y_1, y_2) \) to \( h(y_1, y_2) \).

Function \( h(y_1, y_2) = 2^x y_1^3 \sin(2^x y_1^2)^x y_2 \)

GBS Bernstein Operator: \( m_1 = 20, m_2 = 20 \)

GBS Bernstein Operator: \( m_1 = 30, m_2 = 30 \)

**Figure 2:** The convergence of \( \mathcal{B}_{m_1, m_2}^{\lambda_1, \lambda_2} (h; y_1, y_2) \) to \( h(y_1, y_2) \).
Applying the operator $\mathcal{B}_{m_1,m_2}^{h_1,h_2}$ on both sides of the above inequality

$$
\mathcal{B}_{m_1,m_2}^{h_1,h_2}(h; y_1, y_2) = h(y_1, y_2) \mathcal{B}_{m_1,m_2}^{h_1,h_2}(1; y_1, y_2) - \mathcal{B}_{m_1,m_2}^{h_1,h_2}(1; y_1, y_2)
$$

Now, from Lemma 2, with the help of Cauchy-Schwarz inequality and Remark 1 (in that order), we obtain

$$
\left| \mathcal{B}_{m_1,m_2}^{h_1,h_2}(h; y_1, y_2) - h(y_1, y_2) \right| \\
\leq \mathcal{B}_{m_1,m_2}^{h_1,h_2}(1; y_1, y_2) \left| \Delta_y(b_1, b_2; y_1, y_2) \right| \\
\leq \omega(h; \delta_1, \delta_2) \left( \mathcal{B}_{m_1,m_2}^{h_1,h_2}(1; y_1, y_2) \right)
$$

(50)

$$
+ \frac{1}{\delta_1} \sqrt{\mathcal{B}_{m_1,m_2}^{h_1,h_2}(1; y_1, y_2)} \left| (t_1 - y_1)^2; y_1, y_2 \right| \\
+ \frac{1}{\delta_2} \sqrt{\mathcal{B}_{m_1,m_2}^{h_1,h_2}(1; y_1, y_2)} \left| (t_2 - y_2)^2; y_1, y_2 \right| \\
+ \frac{1}{\delta_1 \delta_2} \sqrt{\mathcal{B}_{m_1,m_2}^{h_1,h_2}(1; y_1, y_2)} \left| (t_1 - y_1)^2; y_1, y_2 \right|
$$

(51)

**Figure 3:** The convergence of $\mathcal{B}_{m_1,m_2}^{h_1,h_2}(h; y_1, y_2)$ and $\mathcal{B}_{m_1,m_2}^{h_1,h_2}(h; y_1, y_2)$ to $h(y_1, y_2)$.

**Table 1:** Error of approximation $\mathcal{E}_{m_1,m_2}^{h_1,h_2}$ for $m_1 = m_2 = 10, 20$ and 30; $q_m = d_m = 0.8$ and $\lambda_1 = \lambda_2 = 0.6$.

</table>
Now, setting \( \delta_i = ([m_i]_{q_{m_i}})^{-1/2}, i = 1, 2 \), the required result is obtained.

For \( 0 < u \leq 1 \), the Lipschitz class of Bögel continuous functions is defined as

\[
Lip_u = \left\{ h \in C_b(S^2) : \left| \Delta_{t_1, t_2} h(t_1, t_2 ; y_1, y_2) \right| \leq L \| t - s \|_u \right\},
\]

(52)

where \( t = (t_1, t_2), s = (y_1, y_2) \in S^2 \) and \( \| t - s \| = \left\{ (t_1 - y_1)^2 + (t_2 - y_2)^2 \right\}^{1/2} \) are the Euclidean norm.

In the next result, we obtain the degree of approximation of the operators \( GBB_{(\lambda_1, \lambda_2)}^{(m_1, m_2)} \) for functions in the Lipschitz-class of Bögel continuous functions.

**Theorem 12.** If \( h \in Lip_u \), then for sufficiently large \( m_1 \) and \( m_2 \), we have

\[
\left\| GBB_{(m_1, m_2)}^{(\lambda_1, \lambda_2)} (h ; y_1, y_2) - (h) \right\|_B \leq L \left\{ \left[m_1\right]^{-1}_{q_{m_1}} + \left[m_2\right]^{-1}_{q_{m_2}} \right\} u/2,
\]

(53)

where \( L \) is a positive constant.

**Proof.** Using the equation (50), Hölder’s inequality, Lemma 2, and Lemma 1, we get

\[
\begin{align*}
& GBB_{(m_1, m_2)}^{(\lambda_1, \lambda_2)} (h ; y_1, y_2) - h(y_1, y_2) \\
& \leq B_{m_1, m_2}^{(\lambda_1, \lambda_2)} \left( \left| \Delta_{t, t} g(y, z) ; y, z \right| \right) \leq L B_{m_1, m_2}^{(\lambda_1, \lambda_2)} \left( \left\| t - s \right\|^{u/2} ; y_1, y_2 \right) \\
& \leq L \left\{ \left[m_1\right]^{-1}_{q_{m_1}} + \left[m_2\right]^{-1}_{q_{m_2}} \right\} u/2.
\end{align*}
\]

(54)

Example 14. For \( m_1 = m_2 = 10, 20 \) and \( 30, \lambda_1 = \lambda_2 = 0.6 \) and \( q_1 = q_2 = 0.8 \), the convergence of \( GBB_{(m_1, m_2)}^{(\lambda_1, \lambda_2)} (h ; y_1, y_2) \) to \( h(y_1, y_2) = 2y_1^2 \sin (2\pi y_1) \sin (2\pi y_2) \) is illustrated in Figure 2.

Denote \( GB_{(\lambda_1, \lambda_2)}^{(m_1, m_2)} (h) \) as the error function of approximation by operators. This example explains the convergence of the operators \( GB_{(\lambda_1, \lambda_2)}^{(m_1, m_2)} (h ; y_1, y_2) \) that are going to the function \( h(y_1, y_2) \) if the values of \( m_1, m_2 \) are increasing.

Comparative results are given in Figure 3, Tables 1 and 2, for the errors of the approximation of \( GB_{(\lambda_1, \lambda_2)}^{(m_1, m_2)} (h ; y_1, y_2) \) and \( GB_{(\lambda_1, \lambda_2)}^{(m_1, m_2)} (h ; y_1, y_2) \) to the functions \( h(y_1, y_2) = 2y_1^2 \sin (2\pi y_1) \sin (2\pi y_2) \) for \( m_1 = m_2 = 30, \lambda_1 = \lambda_2 = 0.6 \), and \( q_1 = q_2 = 0.8 \).

Note that (see Tables 1 and 2 and Figure 3) the GBS-Bernstein operator approximation outperforms others.
