1. Introduction

Some concepts and terminologies related to weighted holomorphic function spaces are briefly recalled in this concerned section.

Suppose that \( D = \{ w \in \mathbb{C} : 0 < |w| < 1 \} \) defines the open unit disc in \( \mathbb{C} \). The class which involves all holomorphic functions in \( D \) is symbolized by \( \mathcal{H}(D) \). Assume that \( d\sigma_w = dx \, dy \) defines the usual normalized area measure on \( D \). Suppose that the known Green’s function on \( D \) is given by \( g(w, a) = \log \left( 1/|\varphi_a(w)| \right) \), with \( \varphi_a(w) = w - a/1 - \bar{a}w \), for \( w, a \in D \). The specific class of all known univalent functions in \( D \) will be symbolized by \( U \) (see [1–3] and others). If \( g \in U \), \( Q = g(D) \), and \( \partial Q \) stands for the Jordan curve, so \( g : D \rightarrow Q \) will be called conformal map [2]. Throughout this manuscript, the function \( \varphi : [0, 1] \rightarrow [0, \infty) \) with \( \varphi(0) = 0 \) and \( \varphi'(0) = 0 \). In addition, the concerned function \( K : [0, \infty) \rightarrow [0, \infty) \) stands for a right-continuous and nondecreasing specific function.

Next, we report the recent advancements of the concepts of specific weighted classes of holomorphic function spaces. The choice of the appropriate functions give the specific essential properties of the underlying weighted classes of functions can have an important impact for the study.

Suppose that

\[
T(\alpha, \omega) = \frac{(1 - |\omega|)^{\alpha}}{\omega(1 - |\omega|)},
\]

\[
T(K(g(w, a)), \omega) = \frac{K(g(w, a))}{\omega(1 - |\omega|)}.
\]

Definition 1 [4–6]. Let \( 0 < \alpha < \infty \). Then, the function \( g \in \mathcal{H}(D) \) is including in \( \alpha \) – weighted Bloch-type space \( \mathcal{B}_{\alpha}^w \), when

\[
\|g\|_{\mathcal{B}_{\alpha}^w} = \sup_{\omega \in D} T(\alpha, \omega)|g'(w)| < \infty.
\]

Definition 2 [4–6]. Let \( 0 < \alpha < \infty \). The function \( g \in \mathcal{H}(D) \) is included in the little specific weighted Bloch-type space \( \mathcal{B}_{\alpha,0}^w \) when
\[ \|g\|_{g_\alpha,\omega} = \lim_{|w| \to 1} T(a, \omega)|g'(w)| = 0. \]  

When \( p \in (0, \infty), q \in (-2, \infty) \), let \( Q_{K,\omega}(p, q) \) be the concerned analytic space that consists of all specific functions \( g \in \mathcal{H}(\mathbb{D}) \) ([5, 6]), for which

\[ \|g\|_{g_\alpha,\omega}^p = \sup_{a \in \mathbb{D}} \int_{\mathbb{D}} |g'(w)|^p (1 - |w|^2)^q T(K(g(w, a)), \omega)d\sigma_w < \infty. \]  

Further, on the boundary of \( \mathbb{D} \), we can say that \( g \in Q_{K,\omega}(p, q) \) belongs to the concerned class \( Q_{K,\omega,0}(p, q) \) when

\[ \lim_{|w| \to 1} \int_{\mathbb{D}} |g'(w)|^p (1 - |w|^2)^q T(K(g(w, a)), \omega)d\sigma_w = 0. \]  

**Remark 3.** For more research on \( Q_{K,\omega}(p, q) \), we refer to [7-11] and others. When \( \omega(t) \equiv 1 \), we obtain the classes \( Q_K(p, q) \) and \( Q_{K,\omega}(p, q) \) (see [12, 13] and others). Also, there are some recent research in Clifford setting (see [14-17] and others).

In this manuscript, we dealt with discussing Schwarzian derivative class on \( Q_{K,\omega}(p, q) \) classes of impulsive problems of conformal mappings which is due to the derivative terms in the definitions of both weighted Bloch and \( Q_{K,\omega}(p, q) \) classes of analytic-type functions. The characterization involved Carleson measures of \( K, \omega \)-type with a combination of the behavior of conformal mappings between the weighted \( Q \)-type functions. For a holomorphic function in the unit disc, the Schwarzian derivative is introduced early in 1873. This derivative was given to generalize and extend the Schwarz-Christoffel derivative type to study some properties of mappings that preserve certain angles. Recently, some authors have used Schwarzian derivative to characterize some results for holomorphic classes of function spaces (see [1, 18-23] and others).

Hereafter, the holomorphic function \( g(w) \) stands for a conformal map, and we shall set \( f(w) = \ln(g'(w)) \). The symbol \( N_g(w) \) denotes the pre-Schwarzian differentiability of \( g(w) \), that is

\[ N_g(w) = \frac{df(w)}{dw} = \frac{g''(w)}{g'(w)}. \]  

The Schwarzian differentiability for the function \( g \) is defined by

\[ S_g(w) = N_g(w) - \frac{1}{2}(N_g(w))^2 = \left( \frac{g''(w)}{g'(w)} \right)' - \frac{1}{2} \left( \frac{g''(w)}{g'(w)} \right)^2. \]  

Some essential basic properties of \( N_g(w) \) and \( S_g(w) \) are stated in [2].

(1) When the function \( g(w) \) is univalent on \( \mathbb{D} \), thus

\[ (1 - |w|^2) |N_g(w)| \leq 6 < \varepsilon^2 \quad \text{and} \quad (1 - |w|^2)^2 |S_g(w)| \leq 6 < \varepsilon^2. \]

(2) If \( (1 - |w|^2) |N_g(w)| \leq 1 \), or \( (1 - |w|^2)^2 |S_g(w)| \leq 2 \), then \( g \) is univalent function on \( \mathbb{D} \).

(3) For all concerned functions \( f \in H(\mathbb{D}) \), we have that \( f \in \mathbb{B} \iff \), we can find \( w \in \mathbb{C} \) and a concerned univalent function \( g \), with \( f = w \ln g' \).

(4) The concerned Schwarzian-type derivative is a Möbius invariant using the equality \( S_{\varphi \circ g} = S_g \), and it is also satisfying \( (1 - |w|^2)^2 |S_{\varphi \circ g}(w)| = (1 - |\varphi_a(w)|^2)^2 |S_g(\varphi_a(w))| \), for every Möbius transformation \( \varphi_a(w) \), \( a \in \mathbb{D} \).

Let the symbol \( I \subset \partial \mathbb{D} \) define a subarc of the boundary of \( \mathbb{D} \). Assume that

\[ S_I(I) = \{ r \xi \in \mathbb{D} : 1 - |r| < r, \xi \in I \}, \]  

when \( |I| \geq 1 \), thus by letting \( S_I(I) = \mathbb{D} \). The specific positive measure \( \mu \) is said to be an actually bounded \( K, \omega \)-Carleson-type measure on the disc \( \mathbb{D} \) when

\[ \sup_{z \in \partial \mathbb{D}} \int_{S_I(I)} \frac{K(|1 - z|/|I|)}{\omega(1 - |z|)} d\mu(z) < \infty. \]  

Moreover, when

\[ \lim_{|I| \to 0} \int_{S_I(I)} \frac{K(|1 - z|/|I|)}{\omega(1 - |z|)} d\mu(z) = 0, \]  

thus \( \mu \) is an actually compact Carleson-type measure of \( K, \omega \)-type.

**Remark 4.** It is very clearly to see that, if \( K(t) = t^p \), and \( \omega(1 - |z|) \equiv 1 \), then \( \mu \) is an actually bounded \( p \)-Carleson-type measure on \( \mathbb{D} \iff (1 - |w|^2)d\mu \) and an actually bounded \( p \)-Carleson-type measure on \( \mathbb{D} \) (see [24]).

The next generic concerned result can be proved as the corresponding result in [25].

**Lemma 5.** A concerned positive measure \( \mu \) on \( \mathbb{D} \) is a concerned Carleson measure of \( K, \omega \)-type \( \iff \)

\[ \sup_{a \in \mathbb{D}} \int_{\mathbb{D}} \frac{K(1 - |\varphi_a(z)|^2)}{\omega(1 - |z|)} d\mu(z) < \infty. \]  

Some general concepts are defined in the following.
Let \( n = 1, 2, \cdots \), then the concerned specific Carleson boxes of dyadic-type are then defined by:
\[
B_{n,m} = \left\{ z = r \re^{\theta} \in \mathbb{D} : 1 - \frac{1}{2^n} \leq |w| < 1, \frac{m}{2^n} \leq \frac{\theta}{\pi} \leq \frac{m+1}{2^n} \right\}, 0 \leq m \leq 2^n+1,
\]
(12)
of side-length \( \ell(B_{n,m}) = 1/2^n \) and their inner half
\[
T(B_{n,m}) = B_{n,m} \cap \left\{ w \in \mathbb{D}_{n,m} : 1 - \frac{1}{2^n} \leq |w| < \frac{1}{2} \ell(B_{n,m}) \right\}.
\]
(13)

For the concerned univalent function \( g \), assume that \( \delta \) and \( \epsilon \) are small enough. If \( B \) is a Carleson-type box of dyadic-type, then it is called that \( B \) is bad when
\[
\sup_{z \in T(B)} (1 - |w|^2) |N_g(w)| \geq \epsilon \text{ also } \sup_{w \in T(B)} (1 - |w|^2)^2 |S_g(w)| \leq \delta.
\]
(14)

Also, \( B \) is said to be a specific maximal-type bad square when the next specific bigger concerned dyadic square \( \hat{B} \) including \( B \) either has the specific equality \( \ell(\hat{B}) = 1/2 \) or has the concerned inequality \( \sup_{w \in T(\hat{B})} (1 - |w|^2)^2 |S_g(w)| > \delta \).

**Lemma 6** [22]. Let \( g \) be a concerned univalent function on the disc \( \mathbb{D} \), and assume that there exists \( g_\delta \in \mathbb{D} \) with \( |S_g(w_0)|^2 (1 - |w_0|^2) > \delta \). Thus, we can find a specific positive constant \( k = k(\delta) < 1 \), for which
\[
|S_g(w)|^2 (1 - |w|^2) > \frac{\delta}{32},
\]
whenever \( w \in \mathbb{D}(w_0, k(1 - |w_0|^2)) \).

Next, some estimations concerning \( \sum w \ell(K(B)) \) will be given. For this result, suppose that
\[
T(\varphi_a, \omega) = \frac{K (1 - |\varphi_a(w)|^2)}{\omega(1 - |w|)}.
\]
(16)

**Lemma 7.** Assume that \( p, \epsilon, \delta \) are positive constants. Hence, for \( \lambda_1, \lambda_2 > 0 \), we have that
\[
\sum_{w} \ell(K(BQ_w)) \leq \lambda_1 + \lambda_2 \int_{\mathbb{D}} |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) d\sigma_w.
\]
(17)

**Proof.** Suppose that \( B \) is a maximal-type square such that \( \ell(B) = 1/2 \). Thus, \( \hat{B} \) is a maximal-type bad square; hence, we can find \( w_0 \in T(\hat{B}) \) with
\[
(1 - |w|^2)^2 |S_g(w_0)| > \delta.
\]
(18)

Therefore, using Lemma 6, we can find a disc \( \mathbb{D}_{w_0} = \mathbb{D}(w_0, c(1 - |w_0|^2)) \subset T(\hat{B}) \) such that
\[
(1 - |w|^2)^2 |S_g(w)| > \frac{\delta}{32}, \forall w \in \mathbb{D}_{w_0}.
\]
(19)

Therefore, we infer that
\[
\ell(K(B)) = \ell(K(\hat{B})) \leq \int_{\mathbb{D}_{w_0}} (1 - |w|^2)^{-2} T(\varphi_a, \omega) d\sigma_w \leq C \int_{\mathbb{D}_{w_0}} |S_g(w)|^p (1 - |w|^2)^{p-2} T(\varphi_a, \omega) d\sigma_w.
\]
(20)

Because the half \( T(\hat{B}_m) \) may be represented by two times only, then there are two specific square types only, \( B \) such that \( \ell(B') = 1/2 \); thus (17) is verified. Then, the concerned lemma is therefore established.

2. **Carleson Measure of \( K, \omega \)-Type and \( Q_{K,\omega}(p, q) \) Spaces**

Certain equivalent concerned general conditions for the \( n \)th derivatives of analytic \( Q_{K,\omega}(p, q) \) classes are obtained in the next generalized result.

**Theorem 8.** Let \( 0 < p < \infty \) and \( -2 < q < \infty \). Assume that \( n \in \mathbb{N} \) and \( f \in \mathcal{H}(\mathbb{D}) \). Hence, the next general concerned quantities are equivalent:

1. \( f \in Q_{K,\omega}(p, q) \)

2. \( |f^{(n)}(w)|^p (1 - |w|^2)^{np-qr} d\sigma_w \) is a Carleson measure
   of \( K, \omega \)-type

3. \( \sup_{w \in \mathbb{D}} |f^{(n)}(w)|^p (1 - |w|^2)^{np-qr} T(\varphi_a, \omega) d\sigma_w < \infty \)

4. \( \sup_{w \in \mathbb{D}} |f^{(n)}(w)|^p (1 - |w|^2)^{np-qr} T(\varphi_a, \omega) d\sigma_w < \infty \).

**Proof.** (1) \( \iff \) (2). This can be obtained as a corresponding concerned part in Theorem 2 (see [13]).

(1) \( \iff \) (3). This can be deduced as the proof of Theorem 1 in [13] by very simple and minor specific modifications.

(2) \( \iff \) (4). Using Lemma 5 for \( d\mu(w) = |f^{(n)}(w)|^p (1 - |w|^2)^{np-qr} d\sigma_w \), then \( \mu \) is a concerned Carleson measure of \( K, \omega \)-type if and only if
\[
\sup_{w \in \mathbb{D}} |f^{(n)}(w)|^p (1 - |w|^2)^{np-qr} T(\varphi_a, \omega) d\sigma_w < \infty.
\]
(21)

Thus, the concerned proof is completely finished.
For the compact Carleson measure of $K, \omega$-type, the following interesting result can be obtained.

**Theorem 9.** Let $p \in (0, \infty)$ and $q \in (-\infty, 0)$. Suppose also $n \in \mathbb{N}$ and the concerned analytic function $f \in H(D)$. Then, the next essential speci-

(a) $f \in Q_{K,0,\omega,0}(p, q)$

(b) $|f^{(n)}(w)|^p (1 - |w|^2)^{n \omega - pq} d\sigma_w$ is a concerned compact Carleson measure of $K, \omega$-type

(c) $\lim_{|w| \to 0} \int_D |f^{(n)}(w)|^p (1 - |w|^2)^{n \omega - pq} T(K(g(w), \omega)) d\sigma_w = 0$

(d) $\int |f^{(n)}(w)|^p (1 - |w|^2)^{n \omega - pq} T(\varphi_{ap}, \omega) d\sigma_w = 0$

Now, we give the following interesting lemma which connects Carleson measure of $K, \omega$-type, Schwarzian derivative and the pre-Schwarzian derivative.

**Lemma 10.** Let $1 \leq p < \infty$, and suppose that $q \in (-\infty, 0)$ with $q - p \leq -2$ and assume that $f = \log^r \in B_0$. Then, if

$$|S_g(w)|^p (1 - |w|^2)^{pq} d\sigma_w$$

is a concerned $K, \omega$-Carleson measure, we have that $|N_g(w)|^p (1 - |w|^2)^{q} d\sigma_w$ is a concerned $K, \omega$-Carleson measure too.

**Proof.** Since $S_g(w) = N_g(w) - 1/2(N_g(w))^2$, then by Theorem 8, we deduce

$$|N_g(w)|^p (1 - |w|^2)^{pq} d\sigma_w$$

is a concerned Carleson measure of $K, \omega$-type $\iff$

is a Carleson measure of $K, \omega$-type, and that $(1 - |w|^2) |N_g(w)| \leq \epsilon^2$ for every $w \in D$. Thus, for any $1 \leq p < \infty$, we obtain that

$$I(a) = \int_D |N_g(w)|^p (1 - |w|^2)^{pq} T(\varphi_{ap}, \omega) d\sigma_w$$

$$\leq 2^{p-1} \int_D |S_g(w)|^p (1 - |w|^2)^{pq} T(\varphi_{ap}, \omega) d\sigma_w$$

$$+ \frac{1}{2} \int_D |N_g(w)|^p (1 - |w|^2)^{pq} T(\varphi_{ap}, \omega) d\sigma_w.$$
The following essential and interesting proposition shall be given.

**Proposition 11.** Let $1 \leq p < \infty$ and $-2 < q < \infty$. When $f = \frac{1}{n} g_n \in \mathcal{O}_{K,p}(p, q)$, then

$$|S_g(w)|^p (1 - |w|^2)^{p+q} d\sigma_w$$

is a concerned Carleson measure of $K, \omega$-type.

**Proof.** Since

$$\|\ln g'\|_{B_p} = \sup_{a \in \mathcal{D}} (1 - |w|^2)|N_g(w)| \leq e^3.$$  (32)

In view of Theorem 8 for $n = 1$ and $f = \ln g'$, we then infer that

$$f = \ln g' \in Q_{K,w}(p, q) \iff |N_g(w)|^p (1 - |w|^2)^q d\sigma_w$$  (33)

is a concerned Carleson measure of $K, \omega$-type.

Moreover, using Theorem 8 with $n = 2$, we deduce that

$$|N_g(w)|^p (1 - |w|^2)^{p+q} d\sigma_w$$  (34)

is a concerned Carleson measure of $K, \omega$-type. Therefore, for $p \geq 1$, we have that

$$|S_g(w)|^p (1 - |w|^2)^{p+q} \leq 2^{p-1}|N_g^p(w)|^p (1 - |w|^2)^{p+q} + \frac{1}{2} (|N_g^p(w)|^2)^{2p}.$$  (35)

Hence,

$$|S_g(w)|^p (1 - |w|^2)^{p+q} \leq 2^{p-1}|N_g^p(w)|^p (1 - |w|^2)^{p+q}$$

$$+ \frac{1}{2} \|\ln g'\|_{B_p} |N_g(w)|^p (1 - |w|^2)^q.$$  (36)

Using (33) and (34), we have

$$|S_g(w)|^p (1 - |w|^2)^{p+q} d\sigma_w$$  (37)

is a concerned Carleson measure of $K, \omega$-type.

The proof is therefore completely finished.

### 3. Results by Logarithmic Characterizations

We give some logarithmic characterizations for univalent functions belonging to the classes

$$S_w = \left\{ \ln g' : g \in \mathcal{U}, \ln g' \in W \right\},$$

where $W$ is the weighted holomorphic $Q_{K,w}(p, q)$ class or the weighted holomorphic $Q_{K,w,0}(p, q)$ class.

**Theorem 12.** Let $p \in [1, \infty)$ and $q \in (-2, \infty)$ also suppose that $q + 2 < p$ or $q = p - 2$ and $K(t) \equiv 1$. Thus, the following fundamental concerned statements are equivalent:

(I) $\ln g' \in Q_{K,w}(p, q)$

(II) $\ln g' \in \mathcal{R}_w$ and $|S_g(w)|^p (1 - |w|^2)^{p+q} d\sigma_w$ is a concerned Carleson measure of $K, \omega$-type.

**Proof.** Assume that the extended choice of the parameters $p, q$ and $g' \in Q_{K,w}(p, q) \subset \mathcal{R}_w$. Then, if $q + 2 < p$, $Q_{K,w}(p, q) \subset \mathcal{R}_w$ with $0 < a < 1$. The concerned proof of (I) $\iff$ (II) can be deduced by Lemma 10 as well as Proposition 11.

**Remark 13.** When $q = p - 2$ and $K(t) \equiv 1, \omega(t) \equiv 1$, that is, the case of the weighted holomorphic Besov-type spaces $B_\omega$. $1 < p < \infty$, it can be proved clearly by remarking that each of these classes is also inclusive in the little Bloch class $\mathcal{B}_0$. This case was presented in [3] too.

**Theorem 14.** Let $p \in [1, \infty)$ and $q \in (-2, \infty)$ and suppose that $q + 2 = p$. Thus,

$$\ln g' \in Q_{K,w}(p, q) \iff |S_g(w)|^p (1 - |w|^2)^{p+q} d\sigma_w$$  (39)

is a concerned Carleson measure of $K, \omega$-type.

**Proof.** Suppose that $\ln g' \in Q_{K,w}(p, q)$; then, by the help of Proposition 11, we deduce that

$$|S_g(w)|^p (1 - |w|^2)^{p+q} d\sigma_w$$  (40)

is a concerned Carleson measure of $K, \omega$-type.

Because the equality $q = p - 2$, we then obtain that $Q_{K,w}(p, q) = Q_{K,w}(p, p - 2)$. Now, the aim is to prove that when

$$|S_g(w)|^p (1 - |w|^2)^{2p-2} d\sigma_w$$  (41)

is a concerned Carleson measure of $K, \omega$-type, then $\ln g' \in Q_{K,w}(p, p - 2)$. Thus, we need to prove that

$$\int |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi, w) d\sigma_w < \infty$$  (42)

implies that

$$\int |N_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi, w) d\sigma_w < \infty.$$  (43)

This is equivalent to

$$\int |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi, w) d\sigma_w < \infty.$$  (44)
Since \( |N_g'(w)|^p \leq 2^{p-1} |S_g(w)|^p + 1/2 |N_g(z)|^p \), then we obtain

\[
\int_{D} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
\leq 2^{p-1} \int_{D} |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
+ \frac{1}{2} \int_{D} |N_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
\leq \epsilon^p \int_{D} |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w + \frac{\lambda \epsilon^p}{2} \int_{D} |N_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w .
\] (45)

Let us now suppose that \( N_g \) is a specific concerned continuous function on \( \overline{D} \), which hence occupy that \( r \to 1 \) for the end of the concerned proof.

Calculating the following specific integral

\[
I_{N_g}(D) = \int_{D} |N_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w.
\] (46)

For \( \epsilon, \delta > 0 \), suppose that \( \Delta = \{ \omega \in \Omega : |S_g(w)| (1 - |w|^2)^2 < \epsilon \} \)

\[ D_1 = \{ w \in D : |S_g(w)| (1 - |w|^2)^2 > \delta \}, \]

\[ D = \Delta \cap D_1 = \{ w \in D : |S_g(w)| (1 - |w|^2)^2 < \epsilon, |S_g(w)| (1 - |w|^2)^2 > \delta \} . \]

Using Theorem 8, we can find a specific constant \( \lambda > 0 \), for which

\[
\int_{D} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
\leq \lambda^p \int_{D} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w .
\] (48)

Then,

\[
I_{N_g}(D) = \int_{D} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
< \epsilon^p \int_{D} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
\leq \lambda \epsilon^p \int_{D} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w .
\] (49)

Since \( |N_g(w)| (1 - |w|^2) < 6 < \epsilon^2 \), we infer that

\[
I_{N_g}(D_1) = \int_{D_1} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
< \epsilon^p \int_{D_1} (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w .
\]

Then,

\[
I_{N_g}(\Delta) = \int_{\Delta} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
\leq \epsilon^p \int_{\Delta} |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w .
\] (50)

Letting us consider the sequence \( \{ B_m \} \) of Carleson bad boxes, then

\[
I_{N_g}(\Delta) = \int_{\Delta} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
< \epsilon^p \int_{\Delta} T(\varphi_a, \omega) \frac{d\sigma_w}{(1 - |w|^2)^2} .
\] (52)

For \( \epsilon > 0 \) such that \( \lambda \epsilon^p < 1 \), we infer that

\[
\int_{D} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
\leq 2^{p-1} \int_{D} |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
+ \frac{\lambda \epsilon^p}{2} \int_{D} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
+ \epsilon^p \int_{D} |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w .
\] (53)

By Lemma 7, we deduce that

\[
\sum_{m} |K(B_m)| \leq C_1 + C_2 \int_{D} |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w .
\] (54)

Letting \( C \) appear as a global concerned positive constant, we may infer that

\[
\left( 1 - \frac{\lambda \epsilon^p}{2} \right) \int_{D_1} |N_g'(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w \\
\leq C \int_{D} |S_g(w)|^p (1 - |w|^2)^{2p-2} T(\varphi_a, \omega) \, d\sigma_w .
\] (55)
Therefore,
\[
\int_D |S_g'(w)|^p \left(1 - |w|^2\right)^{2p-2} T(\varphi, \omega) \, d\sigma_w < \infty, \quad (56)
\]
which gives that
\[
\int_D |N_g'(w)|^p \left(1 - |w|^2\right)^{2p-2} T(\varphi, \omega) \, d\sigma_w < \infty. \quad (57)
\]
This is equivalent to \( \ln g' \in Q_{K,\omega}(p, q) \), and this finishes the proof.

4. Conclusions

Revealing studies on the theory of weighted function spaces evolving the operator theory which includes important and useful studies could enhance research on both theories. In this concerned manuscript, the investigations of emission evolving a class of operators on a general space of weighted functions are then studied. Typically, the possibility of acting the Schwarzian derivative evolving certain Q-type classes is explored. We have revealed that the majority of proof methods supply a snapshot of the role of the Schwarzian derivatives under properties of the weighted class of function spaces. As the definition of the weighted holomorphic Q-type of function class structure, some changes in weights and in the derivative part, the amount of required results entirely is large, and it leads to an efficient clear utility.

To this end, we propose interesting characterizations, a novel of Schwarzian differentially private evolving Q-type of function class releasing the derivative algorithm which reduces the scales and tool up a clear utility.

Data Availability

We have not apply or consider any data during this concerned current research.

Conflicts of Interest

The authors of this concerned study declare completely that they have no any competing of interests.

Acknowledgments
