The theory of convex functions plays an important role in engineering and applied mathematics. The Caputo–Fabrizio fractional derivatives are one of the important notions of fractional calculus. The aim of this paper is to present some properties of Caputo–Fabrizio fractional integral operator in the setting of $h$-convex function. We present some new Caputo–Fabrizio fractional estimates from Hermite–Hadamard-type inequalities. The results of this paper can be considered as the generalization and extension of many existing results of inequalities and convex functions. Moreover, we also present some application of our results to special means of real numbers.

1. Introduction and Preliminaries

The subject of fractional calculus got rapid development because of its diverse applications, not only in mathematics but also into many other fields of sciences. Nowadays, the researchers from biology (e.g., Cesaroni et al. [1] and Caputo and Cametti [2]), economy (e.g., Caputo [3]), demography (e.g., Jumarie [4]), geophysics (e.g., Laflaakano et al. [5]), medicine (e.g., El Sahede [6]), and bioengineering (e.g., Magin [7]) and signal processing are using fractional calculus as a key tool.

Many researchers in the last three decades are studying fractional calculus [8–12]. Some researchers deduced that it is essential to define new fractional derivatives with different singular or nonsingular kernels in order to provide more sufficient area to model more real-world problems in different fields of science and engineering [13–19].

In the present research, we will restrict ourselves to Caputo–Fabrizio fractional derivative. The unique feature of the Caputo–Fabrizio operator is that it has a nonsingular kernel. The main feature of the Caputo–Fabrizio operator can be described as a real power turned into the integer by means of the Laplace transformation, and consequently, the exact solution can be easily found for several problems.

Fractional calculus plays a very significant role in the development of inequality theory. To study convex functions and its generalizations, the Hermite–Hadamard-type inequality is considered as one of the fundamental inequality is given as.

Theorem 1 (see [20]). Let $\psi: J \subseteq \mathbb{R} \rightarrow \mathbb{R}$ be a convex function and $a_i, b_i \in J$ with $a_i < b_i$, then the following double inequality holds:

$$\psi \left( \frac{a_i + b_i}{2} \right) \leq \frac{1}{b_i - a_i} \int_{a_i}^{b_i} \psi(x)\,dx \leq \frac{\psi(a_i) + \psi(b_i)}{2}. \quad (1)$$

The Hermite–Hadamard inequality has been generalized by numerous fractional integral operators [21–23]. For the
interesting readers, we refer [24–27] to study about Hermite–Hadamard inequalities.

The paper is organized as follows: first of all, we give some definitions and preliminary material related to our work. In Section 2, we will establish Hermite–Hadamard-type inequalities via Caputo–Fabrizio fractional integral operator for modified $h$-convex functions. Section 3 is devoted for some new inequalities via Caputo–Fabrizio fractional operator. At last, we give some application to special means and concluding remarks for our paper.

Now, we start by some necessary definitions and preliminary results which will be used and in this paper.

In [28], Toader gave the concept of modified $h$-convex functions as follows.

**Definition 1.** (see [28]). Let $\psi, h: J \subset \mathbb{R} \longrightarrow \mathbb{R}$ be a nonnegative function, then $\psi$ is called modified $h$-convex function, if

$$\psi(aa_1 + (1 - \alpha)b_2) \leq h(\alpha)\psi(a_1) + (1 - h(\alpha))\psi(b_2),$$

(2)

for all $a_1, b_2 \in J$ and $\alpha \in [0, 1]$ holds.

In [8, 29, 30], the concept of Caputo–Fabrizio fractional operator has been given.

**Definition 2** (see [8, 29, 30]). Let $\psi \in H^1(a_1, b_1)$, $a_1 < b_1, \sigma \in [0, 1]$, then the left fractional derivative in the sense of Caputo and Fabrizio is given by

$$\left(\text{CF}^\alpha_tD^\sigma_{a_1} \psi\right)(t) = \frac{B(\sigma)}{1 - \sigma} \int_{a_1}^t \psi'(x)e^{-\sigma(t-x)^p(1-\sigma)} \, dx,$$

(3)

and the associated fractional integral is

$$\left(\text{CF}^\sigma_tI^\alpha_{a_1} \psi\right)(t) = \frac{1 - \sigma}{B(\sigma)} \psi(t) + \frac{\sigma}{B(\sigma)} \int_{a_1}^t \psi(x) \, dx,$$

(4)

where $B(\sigma) > 0$ is a normalization function satisfying $B(0) = B(1) = 1$.

The right fractional derivative is given as

$$\left(\text{CF}^\alpha_tD^\sigma_{b_1} \psi\right)(t) = \frac{-B(\sigma)}{1 - \sigma} \int_{t}^{b_1} \psi'(x)e^{-\sigma(x-t)^p(1-\sigma)} \, dx,$$

(5)

and the associated fractional integral is

$$\left(\text{CF}^\sigma_tI^\alpha_{b_1} \psi\right)(t) = \frac{1 - \sigma}{B(\sigma)} \psi(t) + \frac{\sigma}{B(\sigma)} \int_{t}^{b_1} \psi(x) \, dx.$$

A refinement of power-mean integral inequality is given in the following theorem.

$$\int_{a_1}^{b_1} |\psi(x)||\phi(x)| \, dx$$

$$\leq \frac{1}{b_1 - a_1} \left[ \left( \int_{a_1}^{b_1} (b_1 - x)|\psi(x)|^p \, dx \right)^{\frac{1}{p}} \left( \int_{a_1}^{b_1} (b_1 - x)|\phi(x)|^q \, dx \right)^{\frac{1}{q}} \right] \left[ \left( \int_{a_1}^{b_1} (x - a_1)|\psi(x)|^p \, dx \right)^{\frac{1}{p}} \left( \int_{a_1}^{b_1} (x - a_1)|\phi(x)|^q \, dx \right)^{\frac{1}{q}} \right].$$

(9)

**Theorem 1** (see [31], Lemma 2.1). Let $\psi: J = [a_1, b_1] \longrightarrow \mathbb{R}$ be a differentiable mapping on $J, a_1, b_1 \in J$ with $a_1 < b_1$. If $\psi \in L^1[a_1, b_1]$, then the following equality holds:

$$\frac{\psi(a_1) + \psi(b_1)}{2} - \frac{1}{b_1 - a_1} \int_{a_1}^{b_1} \psi(x) \, dx = \frac{b_1 - a_1}{2} \int_{0}^{1} (1 - 2\alpha)\psi(aa_1 - (1 - \alpha)b_1) \, d\alpha.$$

(7)

Mustafa Gurbuz et al., in [32], generalized the kernel used in Lemma 1 with the help of Caputo–Fabrizio fractional integral operator.

**Lemma 2** (see [32], Lemma 2). Let $\psi: J = [a_1, b_1] \longrightarrow \mathbb{R}$ be a differentiable mapping on $J, a_1, b_1 \in J$ with $a_1 < b_1$. If $\psi \in L^1[a_1, b_1]$ and $\sigma \in [0, 1]$, then the following equality holds:

$$\frac{b_1 - a_1}{2} \int_{0}^{1} (1 - 2\alpha)\psi(aa_1 - (1 - \alpha)b_1) \, d\alpha = -\frac{2(1 - \sigma)}{\sigma(b_1 - a_1)} \psi(k)$$

$$\frac{B(\sigma)}{\sigma(b_1 - a_1)} \left[ \left( \text{CF}^\sigma_tI^\alpha_{a_1} \psi\right)(k) + \left( \text{CF}^\sigma_tI^\alpha_{b_1} \psi\right)(k) \right],$$

(8)

where $k \in [a_1, b_1]$ and $B(\sigma) > 0$ is a normalization function.

Iscan gave a refinement of Hölder integral inequality in [33], which is given in the following theorem.

**Theorem 2** (Hölder–Iscan integral inequality [33]). Let $p > 1$ and $(1/p) + (1/q) = 1$. If $\psi$ and $\phi$ are real functions defined on interval $[a_1, b_1]$ and $|\psi|^p, |\phi|^q$ are integrable functions on $[a_1, b_1]$, then

$$\left( \text{CF}^\sigma_tI^\alpha_{a_1} \psi\right)(t) = \frac{1 - \sigma}{B(\sigma)} \psi(t) + \frac{\sigma}{B(\sigma)} \int_{a_1}^{b_1} \psi(x) \, dx.$$
interval \([a_1, b_1]\) and \(|\psi|, |\psi||g|^q\) are integrable functions on \([a_1, b_1]\), then

\[
\int_{a_1}^{b_1} |\psi(x)\phi(x)|dx \\
\leq \frac{1}{b_1-a_1} \left[ \left( \int_{a_1}^{b_1} (b_1-x) |\psi(x)|dx \right)^{1-(1/q)} \left( \int_{a_1}^{b_1} \sigma a (b_1-x) |\psi(x)|^q dx \right)^{1/q} \right] \\
+ \left( \int_{a_1}^{b_1} (x-a_1) |\psi(x)|dx \right)^{1-(1/q)} \left( \int_{a_1}^{b_1} \sigma a (x-a_1) |\psi(x)|^q dx \right)^{1/q}.
\]

2. Generalization of Hermite–Hadamard Inequality via the Caputo–Fabrizio Fractional Operator

The following theorem is a variant of Hermite–Hadamard inequality for modified \(h\)-convex functions.

\[
\psi\left(\frac{a_1 + b_1}{2}\right) \leq \frac{B(\sigma)}{\sigma(b_1-a_1)} \left[ \left( \psi^{\text{CF}}_{a_1} \right)^{(\sigma b_1)}(k) + \left( \psi^{\text{CF}}_{b_1} \right)^{(\sigma b_1)}(k) - \frac{2(1-\sigma)}{B(\sigma)} \psi(k) \right] \\
\leq \psi(a_1) + [\psi(b_1) - \psi(a_1)] \int_0^1 h(\alpha)d\alpha,
\]

where \(k \in [a_1, b_1]\) and \(B(\sigma) > 0\) is a normalization function.

**Proof.** Since \(\psi\) is modified \(h\)-convex function on \([a_1, b_1]\), we can write

\[
2\psi\left(\frac{a_1 + b_1}{2}\right) \leq \frac{2}{b_1-a_1} \int_{a_1}^{b_1} \psi(x)dx \\
= \frac{2}{b_1-a_1} \left[ \int_{a_1}^{k} \psi(x)dx + \int_{k}^{b_1} \psi(x)dx \right].
\]

Multiplying both sides of (12) by \((\sigma(b_1-a_1)/2B(\sigma))\) and adding \((2(1-\sigma)/B(\sigma))\psi(k))\), we get

\[
\frac{2(1-\sigma)}{B(\sigma)} \psi(k) + \frac{\sigma(b_1-a_1)}{B(\sigma)} \psi\left(\frac{a_1 + b_1}{2}\right) \\
\leq \frac{2(1-\sigma)}{B(\sigma)} \psi(k) + \frac{\sigma}{B(\sigma)} \int_{a_1}^{k} \psi(x)dx + \int_{k}^{b_1} \psi(x)dx \\
= \left[ \frac{(1-\sigma)}{B(\sigma)} \psi(k) + \frac{\sigma}{B(\sigma)} \int_{a_1}^{k} \psi(x)dx \right] + \left[ \frac{(1-\sigma)}{B(\sigma)} \psi(k) + \frac{\sigma}{B(\sigma)} \int_{k}^{b_1} \psi(x)dx \right] \\
= \left( \psi^{\text{CF}}_{a_1} \right)^{(\sigma b_1)}(k) + \left( \psi^{\text{CF}}_{b_1} \right)^{(\sigma b_1)}(k).
\]
After suitable rearrangement of (13), we get the required left-hand side of (11).

For the right-hand side, we will use the right-hand side of Hermite–Hadamard inequality for modified \( h \)-convex functions:

\[
\frac{2}{b_1 - a_1} \int_{a_1}^{b_1} \psi(x) \, dx \leq 2\psi(a_1) + 2[\psi(b_1) - \psi(a_1)] \int_0^1 h(a) \, da.
\]  

(14)

By using the same operator with (12) in (14), we have

\[
\left( \frac{\text{CF} \, I_{\sigma}^\alpha \psi}{a_1} \right)(k) + \left( \frac{\text{CF} \, I_{b_1}^\alpha \psi}{\sigma} \right)(k) \leq \frac{2(1 - \sigma)}{B(\sigma)} \psi(k) + \frac{\sigma(b_1 - a_1)}{B(\sigma)} \left[ \psi(a_1) + [\psi(b_1) - \psi(a_1)] \int_0^1 h(a) \, da \right].
\]

(15)

After suitable rearrangement of (15), we get the required right-hand side of (11), which completes the proof. \( \square \)

Remark 1. If we take \( h(a) = \alpha \), then inequality (11) reduces to the Hermite–Hadamard inequality for convex functions via Caputo–Fabrizio fractional operator [32].

\[
\frac{2B(\sigma)}{\sigma(b_1 - a_1)} \left( \frac{\text{CF} \, I_{\sigma}^\alpha \psi}{a_1} \right)(k) + \left( \frac{\text{CF} \, I_{b_1}^\alpha \psi}{\sigma} \right)(k) - \frac{2(1 - \sigma)}{B(\sigma)} \psi(k)(k) \leq 2[M(a_1, b_1) - N(a_1, b_1)] \int_0^1 |h(\alpha)|^2 \, d\alpha
\]

\[+ 2\psi(b_1)\phi(b_1) + 2[N(a_1, b_1) - 2\psi(b_1)\phi(b_1)] \int_0^1 h(\alpha) \, da,
\]

where

\[
M(a_1, b_1) = \psi(a_1)\phi(a_1) + \psi(b_1)\phi(b_1),
\]

\[
N(a_1, b_1) = \psi(a_1)\phi(b_1) + \psi(b_1)\phi(a_1),
\]

(16)

(17)

\( k \in [a_1, b_1], \text{ and } B(\sigma) > 0 \text{ is a normalization function.} \)

Proof. Since \( \psi \) and \( \phi \) are convex on \( [a_1, b_1] \), we have

\[
\psi(aa_1 + (1 - \alpha)b_1) = \psi(aa_1 + (1 - \alpha)b_1) \leq \psi(a_1) + (1 - h(\alpha))\psi(b_1), \quad \forall \alpha \in [0, 1],
\]

(18)

\[
\phi(aa_1 + (1 - \alpha)b_1) = \phi(aa_1 + (1 - \alpha)b_1) \leq h(\alpha)\phi(a_1) + (1 - h(\alpha))\phi(b_1), \quad \forall \alpha \in [0, 1].
\]

(19)

Multiplying both sides of (18) and (19), we have

\[
\psi(aa_1 + (1 - \alpha)b_1)\phi(aa_1 + (1 - \alpha)b_1) \leq [h(\alpha)]^2\psi(a_1)\phi(a_1) + [1 - h(\alpha)]^2\psi(b_1)\phi(b_1) + h(\alpha)[1 - h(\alpha)][\psi(a_1)\phi(b_1) + \psi(b_1)\phi(a_1)].
\]

(20)
Integrating (20) with “α” over [0, 1], and using the change of variable technique, we obtain

\[
\frac{1}{b_1 - a_1} \int_{a_1}^{b_1} \psi(x)\phi(x)dx 
\leq \int_0^1 [h(\alpha)]^2\psi(a_1)\phi(a_1) + [1 - h(\alpha)]^2\psi(b_1)\phi(b_1)]d\alpha 
+ \int_0^1 [h(\alpha)\{1 - h(\alpha)\} \{\psi(a_1)\phi(b_1) + \psi(b_1)\phi(a_1)\}]d\alpha
\leq M(a_1, b_1) \int_0^1 [h(\alpha)]^2d\alpha + \psi(b_1)\phi(b_1) \int_0^1 [1 - 2h(\alpha)]d\alpha 
+ N(a_1, b_1) \int_0^1 h(\alpha)[1 - h(\alpha)]d\alpha.
\]

So,

\[
\frac{2}{b_1 - a_1} \int_{a_1}^{b_1} \psi(x)\phi(x)dx 
\leq 2[M(a_1, b_1) - N(a_1, b_1)] \int_0^1 [h(\alpha)]^2d\alpha + 2\psi(b_1)\phi(b_1) 
+ 2[N(a_1, b_1) - 2\psi(b_1)\phi(b_1)] \int_0^1 h(\alpha)d\alpha.
\]

Multiplying both sides of (22) by \((\sigma(b_1 - a_1)/2B(\sigma))\) and adding \((2(1 - \sigma)/B(\sigma))\psi(k)\phi(k)\), we get

\[
\frac{2(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k) + \frac{\sigma}{B(\sigma)} \left[ \int_{a_1}^{b_1} \psi(x)\phi(x)dx + \int_{a_1}^{b_1} \psi(x)\phi(x)dx \right] 
\leq \frac{2(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k) + \frac{\sigma(b_1 - a_1)}{2B(\sigma)} \left[ 2[M(a_1, b_1) - N(a_1, b_1)] \int_0^1 [h(\alpha)]^2d\alpha 
+ 2\psi(b_1)\phi(b_1) + 2[N(a_1, b_1) - 2\psi(b_1)\phi(b_1)] \int_0^1 h(\alpha)d\alpha \right].
\]

So,

\[
\left[ \frac{1 - \sigma}{B(\sigma)} \psi(k)\phi(k) + \frac{\sigma}{B(\sigma)} \int_{a_1}^{b_1} \psi(x)\phi(x)dx \right] 
+ \left[ \frac{1 - \sigma}{B(\sigma)} \psi(k)\phi(k) + \frac{\sigma}{B(\sigma)} \int_{a_1}^{b_1} \psi(x)\phi(x)dx \right] 
\leq \frac{2(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k) + \frac{\sigma(b_1 - a_1)}{2B(\sigma)} \left[ 2[M(a_1, b_1) - N(a_1, b_1)] \int_0^1 [h(\alpha)]^2d\alpha 
+ 2\psi(b_1)\phi(b_1) + 2[N(a_1, b_1) - 2\psi(b_1)\phi(b_1)] \int_0^1 h(\alpha)d\alpha \right].
\]
Thus,

\[
\left( \frac{\mathcal{C}F \int \phi}{a_1} \right)(k) + \left( \frac{\mathcal{C}F \int \phi}{b_1} \right)(k) \\
\leq \frac{2(1 - \sigma)}{B(\sigma)} \psi(k) \phi(k) + \frac{\sigma(b_1 - a_1)}{2B(\sigma)} \left[ 2[M(a_1, b_1) - N(a_1, b_1)] \int_0^1 [h(\alpha)]^2 d\alpha \right] + 2\psi(b_1)\phi(b_1) + 2[N(a_1, b_1) - 2\psi(b_1)\phi(b_1)] \int_0^1 [h(\alpha)] d\alpha,
\]

with suitable rearrangements, and the proof is completed. \(\square\)

**Remark 2.** If we take \(h(\alpha) = \alpha\) in Theorem 5, we obtain ([32], Theorem 3).

\[
\frac{1}{h(1/2)[1 - h(1/2)]} \psi\left( \frac{a_1 + b_1}{2} \right) \phi\left( \frac{a_1 + b_1}{2} \right) - \frac{B(\sigma)}{\sigma(b_1 - a_1)} \left[ [h(1/2)]^2 + [1 - h(1/2)]^2 \right] \\
\leq 2M(a_1, b_1) \int_0^1 h(\alpha)[1 - h(\alpha)] d\alpha + N(a_1, b_1) \int_0^1 [h(\alpha)]^2 d\alpha,
\]

where

\[
M(a_1, b_1) = \psi(a_1)\phi(a_1) + \psi(b_1)\phi(b_1),
\]

\[
N(a_1, b_1) = \psi(a_1)\phi(b_1) + \psi(b_1)\phi(a_1),
\]

and \(k \in [a_1, b_1]\), and \(B(\sigma) > 0\) is a normalization function.

**Proof.** Since \(\psi\) and \(\phi\) are modified \(h\)-convex functions on \(J\), then for \(\alpha = (1/2)\), we have

\[
\psi\left( \frac{a_1 + b_1}{2} \right) \leq h\left( \frac{1}{2} \right) \psi((1 - \alpha)a_1 + ab_1) + \left[ 1 - h\left( \frac{1}{2} \right) \right] \psi(aa_1 + (1 - \alpha)b_1),
\]

\[
\phi\left( \frac{a_1 + b_1}{2} \right) \leq h\left( \frac{1}{2} \right) \phi((1 - \alpha)a_1 + ab_1) + \left[ 1 - h\left( \frac{1}{2} \right) \right] \phi(aa_1 + (1 - \alpha)b_1).
\]
Multiplying the above inequalities at both sides, we have

\[
\psi\left(\frac{a_1 + b_1}{2}\right)\phi\left(\frac{a_1 + b_1}{2}\right)
\leq \left[ h\left(\frac{1}{2}\right) \right]^2 \psi((1 - \alpha)a_1 + ab_1)\phi((1 - \alpha)a_1 + ab_1)
\]

\[
+ \left[ 1 - h\left(\frac{1}{2}\right) \right]^2 \psi(aa_1 + (1 - \alpha)b_1)\phi(aa_1 + (1 - \alpha)b_1)
\]

\[
+ \left[ h\left(\frac{1}{2}\right)\right][1 - h\left(\frac{1}{2}\right)] \psi((1 - \alpha)a_1 + ab_1)\phi(aa_1 + (1 - \alpha)b_1) + \psi(aa_1 + (1 - \alpha)b_1)\phi((1 - \alpha)a_1 + ab_1)]
\]

\[
\leq \left[ h\left(\frac{1}{2}\right) \right]^2 \psi((1 - \alpha)a_1 + ab_1)\phi((1 - \alpha)a_1 + ab_1)
\]

\[
+ \left[ 1 - h\left(\frac{1}{2}\right) \right]^2 \psi(aa_1 + (1 - \alpha)b_1)\phi(aa_1 + (1 - \alpha)b_1)
\]

\[
+ \left[ h\left(\frac{1}{2}\right)\right][1 - h\left(\frac{1}{2}\right)] \psi((1 - \alpha)a_1 + ab_1)\phi(aa_1 + (1 - \alpha)b_1) + \psi(aa_1 + (1 - \alpha)b_1)\phi((1 - \alpha)a_1 + ab_1)]
\]

\[
\leq \left[ h\left(\frac{1}{2}\right) \right]^2 \psi((1 - \alpha)a_1 + ab_1)\phi((1 - \alpha)a_1 + ab_1)
\]

(29)
Integrating (29) with respect to $\alpha$ over $[0,1]$ and using change of variable technique, we obtain

\[
2\psi\left(\frac{a_1 + b_1}{2}\right)\phi\left(\frac{a_1 + b_1}{2}\right) \leq \left[h\left(\frac{1}{2}\right)\right]^2 + \left[1 - h\left(\frac{1}{2}\right)\right]^2
\]

\[
\left(\frac{2}{b_1 - a_1}\right) \int_{a_1}^{b_1} \psi(x)\phi(x)dx + 2h\left(\frac{1}{2}\right)\left[1 - h\left(\frac{1}{2}\right)\right]\left[2M(a_1, b_1)\int_0^1 h(\alpha)[1 - h(\alpha)]d\alpha \right]
\]

\[
+ N(a_1, b_1)\int_0^1 \left[h(\alpha)\right]^2 + \left[1 - h(\alpha)\right]^2 d\alpha
\]

So,

\[
\frac{2}{[h(1/2)]^2 + [1 - h(1/2)]^2} \psi\left(\frac{a_1 + b_1}{2}\right)\phi\left(\frac{a_1 + b_1}{2}\right) \leq \frac{2}{b_1 - a_1} \int_{a_1}^{b_1} \psi(x)\phi(x)dx
\]

\[
+ \frac{2h(1/2), [1 - h(1/2)]}{[h(1/2)]^2 + [1 - h(1/2)]^2}\left[2M(a_1, b_1)\int_0^1 h(\alpha)[1 - h(\alpha)]d\alpha \right]
\]

\[
+ N(a_1, b_1)\int_0^1 \left[h(\alpha)\right]^2 + \left[1 - h(\alpha)\right]^2 d\alpha
\]

Multiplying both sides of (31) by $(\sigma(b_1 - a_1)/2B(\sigma))$ and adding $(2(1 - \sigma)/B(\sigma))\psi(k)\phi(k)$, we get

\[
\frac{\sigma(b_1 - a_1)}{B(\sigma)[[h(1/2)]^2 + [1 - h(1/2)]^2] \psi\left(\frac{a_1 + b_1}{2}\right)\phi\left(\frac{a_1 + b_1}{2}\right) + \frac{2(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k)
\]

\[
\leq \frac{\sigma}{B(\sigma)} \int_{a_1}^{b_1} \psi(x)\phi(x)dx + \int_{a_1}^{b_1} \psi(x)\phi(x)dx
\]

\[
+ \frac{\sigma(b_1 - a_1)h(1/2), [1 - h(1/2)]}{B(\sigma)[[h(1/2)]^2 + [1 - h(1/2)]^2] \left[2M(a_1, b_1)\int_0^1 h(\alpha)[1 - h(\alpha)]d\alpha \right]
\]

\[
+ N(a_1, b_1)\int_0^1 \left[h(\alpha)\right]^2 + \left[1 - h(\alpha)\right]^2 d\alpha
\]

\[
\leq \left[\frac{(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k) + \frac{\sigma}{B(\sigma)} \int_{a_1}^{b_1} \psi(x)\phi(x)dx\right] + \left[\frac{(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k) + \frac{\sigma}{B(\sigma)} \int_{a_1}^{b_1} \psi(x)\phi(x)dx\right]
\]

\[
+ \frac{\sigma(b_1 - a_1)h(1/2), [1 - h(1/2)]}{B(\sigma)[[h(1/2)]^2 + [1 - h(1/2)]^2] \left[2M(a_1, b_1)\int_0^1 h(\alpha)[1 - h(\alpha)]d\alpha \right]
\]

\[
+ N(a_1, b_1)\int_0^1 \left[h(\alpha)\right]^2 + \left[1 - h(\alpha)\right]^2 d\alpha
\]

Thus,
\[
\frac{\sigma(b_1-a_1)}{B(\sigma)[[h(1/2)]^2 + [1 - h(1/2)]^2]} \psi\left(\frac{a_1 + b_1}{2}\right) \phi\left(\frac{a_1 + b_1}{2}\right) + \frac{2(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k)
\]

\[
\leq \left(\frac{\text{CF} I_{1/2}^\sigma \psi \phi}{\sigma(1 - \sigma)} \psi(k)\phi(k)\right) + \frac{2(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k)
\]

\[
+ \sigma(b_1-a_1)h(1/2), [1 - h(1/2)] \left[ 2M(a_1,b_1) \int_0^1 h(\alpha)[1 - h(\alpha)] d\alpha \right]
\]

\[
+ N(a_1,b_1) \int_0^1 [h(\alpha)]^2 [1 - h(\alpha)]^2 d\alpha.
\]

This implies that

\[
\frac{\sigma(b_1-a_1)}{B(\sigma)[[h(1/2)]^2 + [1 - h(1/2)]^2]} \psi\left(\frac{a_1 + b_1}{2}\right) \phi\left(\frac{a_1 + b_1}{2}\right)
\]

\[
- \left[\left(\frac{\text{CF} I_{1/2}^\sigma \psi \phi}{\sigma(1 - \sigma)} \psi(k)\phi(k)\right) + \frac{2(1 - \sigma)}{B(\sigma)} \psi(k)\phi(k)\right]
\]

\[
\leq \sigma(b_1-a_1)h(1/2), [1 - h(1/2)] \left[ 2M(a_1,b_1) \int_0^1 h(\alpha)[1 - h(\alpha)] d\alpha \right]
\]

\[
+ N(a_1,b_1) \int_0^1 [h(\alpha)]^2 [1 - h(\alpha)]^2 d\alpha.
\]

Multiplying both sides of the above inequality by \((B(\sigma)[[h(1/2)]^2 + [1 - h(1/2)]^2]) / (\sigma(b_1-a_1)h(1/2), [1 - h(1/2)])\), we obtain our required result.

**Remark 3.** If we take \(h(\alpha) = \alpha\) in Theorem 6, we obtain ([32], Theorem 4).

### 3. Some New Results Related with Caputo–Fabrizio Fractional Operator

In this section, we establish some new inequalities for modified \(h\)-convex functions via Caputo–Fabrizio fractional operator.

**Theorem 7.** Let \(\psi: J \longrightarrow \mathbb{R}\) be a differentiable function on \(J\). If \(|\psi'|\) is a modified \(h\)-convex function on interval \([a_1, b_1]\), where \(a_1, b_1 \in J\) with \(a_1 < b_1\), \(\psi' \in L_1[a_1, b_1]\) and \(\sigma \in [0, 1]\), then the following inequality holds:

\[
\left| \frac{\psi(a_1) + \psi(b_1)}{2} + \frac{2(1 - \sigma)}{\sigma(b_1-a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1-a_1)} \left[ \left(\frac{\text{CF} I_{1/2}^\sigma \psi}{\sigma(1 - \sigma)} \psi(k)\right) + \left(\frac{\text{CF} I_{1/2}^\sigma \psi}{\sigma(1 - \sigma)} \psi(k)\right) \right] \right|
\]

\[
\leq \frac{b_1-a_1}{2} \left[ \left| \psi'(b_1) \right| + \left| \psi'(a_1) \right| \right] \int_0^1 [1 - 2\alpha] h(\alpha) d\alpha.
\]
where $k \in [a_1, b_1]$, and $B(\sigma) > 0$ is a normalization function. Proof. Using Lemma 2 and the definition of modified $h$-convexity of $|\psi'|$, we get

\[
\frac{\psi(a_1) + \psi(b_1)}{2} + \frac{2(1-\sigma)}{\sigma(b_1-a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1-a_1)} \left[ \left( \int_{C_F} f_\sigma^\sigma \psi \right)(k) + \left( \int_{C_F} I_\sigma f_\sigma^\sigma \psi \right)(k) \right]
\]

\[
\leq \frac{b_1-a_1}{2} \int_0^1 \left| 1 - 2\alpha \| \psi'(aa_1 - (1-\alpha)b_1) \| \right| \, \mathrm{d}\alpha
\]

\[
\leq \frac{b_1-a_1}{2} \int_0^1 \left| 1 - 2\alpha \| \psi'(a_1) \| + (1-h(\alpha))|\psi'(b_1)| \right| \, \mathrm{d}\alpha
\]

\[
\leq \frac{b_1-a_1}{2} \left[ \left| \psi'(a_1) \right| \int_0^1 \left| 1 - 2\alpha h(\alpha) \right| \, \mathrm{d}\alpha + \left| \psi'(b_1) \right| \int_0^1 \left| 1 - 2\alpha (1-h(\alpha)) \right| \, \mathrm{d}\alpha \right]
\]

\[
\leq \frac{b_1-a_1}{2} \left[ \left| \psi'(b_1) \right| \int_0^1 \left| 1 - 2\alpha \right| \, \mathrm{d}\alpha + \left[ \left| \psi'(a_1) \right| - \left| \psi'(b_1) \right| \right] \int_0^1 \left| 1 - 2\alpha h(\alpha) \right| \, \mathrm{d}\alpha \right].
\]

which completes the proof.

\]

\[
\frac{\psi(a_1) + \psi(b_1)}{2} + \frac{2(1-\sigma)}{\sigma(b_1-a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1-a_1)} \left[ \left( \int_{C_F} f_\sigma^\sigma \psi \right)(k) + \left( \int_{C_F} I_\sigma f_\sigma^\sigma \psi \right)(k) \right]
\]

\[
\leq \frac{b_1-a_1}{2} \left( \frac{1}{p+1} \right)^{(1/q)} \times \left[ \left| \psi'(b_1) \right|^q + \left[ \left| \psi'(a_1) \right|^q - \left| \psi'(b_1) \right|^q \right] \int_0^1 h(\alpha) \, \mathrm{d}\alpha \right]^{(1/q)}
\]

where $k \in [a_1, b_1]$, and $B(\sigma) > 0$ is a normalization function. Proof. Using Lemma 2, Hölder’s inequality and modified $h$-convexity of $|\psi'|^q$, we get

\[
\frac{\psi(a_1) + \psi(b_1)}{2} + \frac{2(1-\sigma)}{\sigma(b_1-a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1-a_1)} \left[ \left( \int_{C_F} f_\sigma^\sigma \psi \right)(k) + \left( \int_{C_F} I_\sigma f_\sigma^\sigma \psi \right)(k) \right]
\]

\[
\leq \frac{b_1-a_1}{2} \int_0^1 \left| 1 - 2\alpha \| \psi'(aa_1 - (1-\alpha)b_1) \| \right| \, \mathrm{d}\alpha
\]

\[
\leq \frac{b_1-a_1}{2} \times \left[ \left( \int_0^1 \left| 1 - 2\alpha \right|^p \, \mathrm{d}\alpha \right)^{(1/p)} \left( \int_0^1 \left| \psi'(aa_1 - (1-\alpha)b_1) \right|^q \, \mathrm{d}\alpha \right)^{(1/q)} \right]
\]

\[
\leq \frac{b_1-a_1}{2} \left( \frac{1}{p+1} \right)^{(1/p)} \times \left[ \left( \int_0^1 \left| \psi'(aa_1 - (1-\alpha)b_1) \right|^q \, \mathrm{d}\alpha \right)^{(1/q)} \right]
\]

\[
\leq \frac{b_1-a_1}{2} \left( \frac{1}{p+1} \right)^{(1/p)} \times \left[ \left( \int_0^1 \left| h(\alpha) \psi'(a_1) \right|^q + (1-h(\alpha))|\psi'(b_1)|^q \right) \, \mathrm{d}\alpha \right]^{(1/q)}
\]

\[
\leq \frac{b_1-a_1}{2} \left( \frac{1}{p+1} \right)^{(1/p)} \times \left[ \left| \psi'(b_1) \right|^q + \left[ \left| \psi'(a_1) \right|^q - \left| \psi'(b_1) \right|^q \right] \int_0^1 h(\alpha) \, \mathrm{d}\alpha \right]^{(1/q)}
\]

\]

**Theorem 8.** Let $\psi: J \rightarrow \mathbb{R}$ be a positive differentiable function on $J$. If $|\psi'|^q$ is a modified $h$-convex function on interval $[a_1, b_1]$ with $a_1 < b_1, q > 1, (1/p) + (1/q) = 1$, where $a_1, b_1 \in J$ with $a_1 < b_1, \psi \in L_1[a_1, b_1]$ and $\sigma \in [0, 1]$, then the following inequality holds:
which completes the proof. □

Remark 5. If we take \( h(\alpha) = \alpha \) in Theorem 8, we obtain ([32], Theorem 6).

\[
\left| \psi(a_1) + \psi(b_1) \right| \leq \frac{2(1-\sigma)}{\sigma(b_1-a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1-a_1)} \left[ \left( \frac{\psi(a_1)}{\sigma} \right)^\sigma + \left( \frac{\psi(b_1)}{\sigma} \right)^\sigma \right] \left( 1 - 2\alpha h(\alpha)d\alpha \right) \tag{39}
\]

where \( k \in [a_1, b_1] \), and \( B(\sigma) > 0 \) is a normalization function.

Proof. Assuming \( q > 1 \), using Lemma 2 and the power mean inequality and modified \( h \)-convexity of \( |\psi'|^q \), we get

\[
\left| \psi(a_1) + \psi(b_1) \right| \leq \frac{2(1-\sigma)}{\sigma(b_1-a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1-a_1)} \left[ \left( \frac{\psi(a_1)}{\sigma} \right)^\sigma + \left( \frac{\psi(b_1)}{\sigma} \right)^\sigma \right] \left( 1 - 2\alpha h(\alpha)d\alpha \right) \tag{40}
\]

For \( q = 1 \), we use the estimates of Theorem 7, which also follows step by step the above estimates. This completes the proof of theorem. □

Remark 6

1. Under the assumptions of Theorem 9 with \( q = 1 \), we get conclusion of Theorem 7
2. If we take \( h(\alpha) = \alpha \) and \( q = 1 \) in Theorem 9, we obtain ([32], Theorem 5)

Theorem 9. Let \( \psi: J \rightarrow \mathbb{R} \) be a positive differentiable function on \( J \). If \( |\psi'|^q \) is a modified \( h \)-convex function on interval \( [a_1, b_1] \), \( a_1, b_1 \in J \) with \( a_1 < b_1, q \geq 1 \), where \( a_1, b_1 \in J \) with \( a_1 < b_1, \psi \in L_1[a_1, b_1] \) and \( \sigma \in [0, 1] \), then the following inequality holds:

\[
\left| \psi(a_1) + \psi(b_1) \right| \leq \frac{2(1-\sigma)}{\sigma(b_1-a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1-a_1)} \left[ \left( \frac{\psi(a_1)}{\sigma} \right)^\sigma + \left( \frac{\psi(b_1)}{\sigma} \right)^\sigma \right] \left( 1 - 2\alpha h(\alpha)d\alpha \right) \tag{39}
\]

Now, we will prove Theorems 8 and 9 by Hölder–Iscan and improved power mean integral inequality, respectively. Then, we will show that the results we have obtained in these theorems gives better approximation of Theorems 8 and 9, respectively.

Theorem 10. Let \( \psi: J \rightarrow \mathbb{R} \) be a positive differentiable function on \( J \). If \( |\psi'|^q \) is a modified \( h \)-convex function on interval \( [a_1, b_1] \), \( a_1, b_1 \in J \) with \( a_1 < b_1, q > 1 \), \((1/p) + (1/q) = 1 \), where \( a_1, b_1 \in J \) with \( a_1 < b_1, \psi \in L_1[a_1, b_1] \) and \( \sigma \in [0, 1] \), then the following inequality holds:
where $k \in [a_1, b_1]$, and $B(\sigma) > 0$ is a normalization function. Proof. Using Lemma 2, Hölder–Iscan integral inequality and modified $h$-convexity of $|\psi'|^q$, we get

\[
\frac{1}{2} \left( \frac{1}{2} + \frac{1}{p+1} \right) \left( \int_0^1 |1-2\alpha| |a| \psi'(aa_1 - (1-\alpha)b_1) |^p d\alpha \right)^{1/p} \left( \int_0^1 (1-\alpha) |\psi'(aa_1 - (1-\alpha)b_1) |^q d\alpha \right)^{1/q} \leq \frac{b_1 - a_1}{2} \int_0^1 |1-2\alpha| |a| \psi'(aa_1 - (1-\alpha)b_1) |^p d\alpha \leq \frac{b_1 - a_1}{2} \left( \int_0^1 (1-\alpha) |\psi'(aa_1 - (1-\alpha)b_1) |^q d\alpha \right)^{1/q} + \frac{b_1 - a_1}{2} \left( \int_0^1 (1-\alpha) |\psi'(aa_1 - (1-\alpha)b_1) |^q d\alpha \right)^{1/q}
\]
which completes the proof.

\[ \psi(a_i) + \psi(b_i) \]

\[ \frac{1}{2} \left[ \frac{\psi(a_i) + \psi(b_i)}{2} \right] + 2 \left( 1 - \sigma \right) \frac{\psi(k)}{\sigma(b_i - a_i)} \psi(k) - \frac{B(\sigma)}{\sigma(b_i - a_i)} \left[ \left( C_F^a \psi \right)(k) + \left( C_F^{b_i} \psi \right)(k) \right] \]

\[ \leq \frac{b_i - a_i}{4} \left( \frac{1}{p+1} \right)^{(1/p)} \times \left[ \left( \left| \psi \right| \right)^{q} + \frac{2}{3} \left( \left| \psi \right| \right)^{q} \right] \left( \frac{1}{q} \right) + \left( \frac{2}{3} \left( \left| \psi \right| \right)^{q} \right) \left( \frac{1}{q} \right). \]

\[ (43) \]

**Remark 7.** The inequality (41) gives better results than inequality [35], and we have the following inequality:

\[ \frac{b_i - a_i}{2} \left( \frac{1}{2(p+1)} \right) \times \left[ \left( \frac{\psi \left( a_i \right)}{2} \right) + \left( \left| \psi \right| \left( a_i \right) - \left| \psi \right| \left( b_i \right) \right) \right] \int_0^1 (1 - a) h(a) \, da \]

\[ + \frac{b_i - a_i}{2} \left( \frac{1}{2(p+1)} \right) \times \left[ \left( \frac{\psi \left( b_i \right)}{2} \right) + \left( \left| \psi \right| \left( a_i \right) - \left| \psi \right| \left( b_i \right) \right) \right] \int_0^1 h(a) \, da \]

\[ \leq \frac{b_i - a_i}{2} \left( \frac{1}{p+1} \right) \times \left[ \left( \frac{\psi \left( b_i \right)}{2} \right) + \left( \left| \psi \right| \left( a_i \right) - \left| \psi \right| \left( b_i \right) \right) \right] \int_0^1 h(a) \, da \]

\[ (44) \]

**Proof.** Using concavity of \( \mu : [0, \infty) \rightarrow \mathbb{R}, \mu(x) = x^\lambda, 0 < \lambda \leq 1 \), we get

\[ \frac{b_i - a_i}{2} \left( \frac{1}{2(p+1)} \right) \times \left[ \left( \frac{\psi \left( b_i \right)}{2} \right) + \left( \left| \psi \right| \left( a_i \right) - \left| \psi \right| \left( b_i \right) \right) \right] \int_0^1 (1 - a) h(a) \, da \]

\[ + \frac{b_i - a_i}{2} \left( \frac{1}{2(p+1)} \right) \times \left[ \left( \frac{\psi \left( b_i \right)}{2} \right) + \left( \left| \psi \right| \left( a_i \right) - \left| \psi \right| \left( b_i \right) \right) \right] \int_0^1 h(a) \, da \]

\[ \leq \frac{b_i - a_i}{2} \left( \frac{1}{p+1} \right) \times \left[ \left( \frac{\psi \left( b_i \right)}{2} \right) + \left( \left| \psi \right| \left( a_i \right) - \left| \psi \right| \left( b_i \right) \right) \right] \int_0^1 h(a) \, da \]

\[ (45) \]

which completes the proof.

**Theorem 11.** Let \( \psi : [0, \infty) \rightarrow \mathbb{R} \) be a positive differentiable function on \( I \). If \( \left| \psi \right|^q \) is a modified \( h \)-convex function on

\[ \left| \frac{\psi(a_i) + \psi(b_i)}{2} \right| + 2 \left( 1 - \sigma \right) \frac{\psi(k)}{\sigma(b_i - a_i)} \psi(k) - \frac{B(\sigma)}{\sigma(b_i - a_i)} \left[ \left( C_F^a \psi \right)(k) + \left( C_F^{b_i} \psi \right)(k) \right] \]

\[ \leq \frac{b_i - a_i}{2} \left( \frac{1}{4} \right) \times \left[ \left( \frac{\psi \left( b_i \right)}{4} \right) + \left( \left| \psi \right| \left( a_i \right) - \left| \psi \right| \left( b_i \right) \right) \right] \int_0^1 (1 - a) \left( 1 - 2a \right) h(a) \, da \]

\[ + \frac{b_i - a_i}{2} \left( \frac{1}{4} \right) \times \left[ \left( \frac{\psi \left( b_i \right)}{4} \right) + \left( \left| \psi \right| \left( a_i \right) - \left| \psi \right| \left( b_i \right) \right) \right] \int_0^1 a \left( 1 - 2a \right) h(a) \, da \]

\[ (46) \]
where \( k \in [a_1, b_1] \), and \( B(\sigma) > 0 \) is a normalization function.

**Proof.** Assuming \( q > 1 \) and using Lemma 2, improved power-mean integral inequality and modified \( h \)-convexity of \( |\psi'|^q \), we get

\[
\left| \frac{\psi(a_1) + \psi(b_1)}{2} + \frac{2(1 - \sigma)}{\sigma(b_1 - a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1 - a_1)} \left[ \int_0^{\psi} \left( \begin{array}{c} \text{CF}_{\sigma} \psi \end{array} \right)(k) \right] + \left( \text{CF}_{\sigma} \psi \right)(k) \right| ≤ \frac{b_1 - a_1}{2} \int_0^1 |1 - 2\alpha| \psi' (\alpha a_1 - (1 - \alpha) b_1) \, d\alpha
\]

\[
≤ \frac{b_1 - a_1}{2} \times \left( \int_0^1 (1 - \alpha)|1 - 2\alpha| \, d\alpha \right)^{1/2} \left( \int_0^1 (1 - \alpha)|1 - 2\alpha| |\psi' (\alpha a_1 - (1 - \alpha) b_1)|^q \, d\alpha \right)^{1/q}
\]

\[
+ \frac{b_1 - a_1}{2} \times \left( \int_0^1 |\psi'(1 - \alpha)|^q \, d\alpha \right)^{1/q}
\]

(47)

For \( q = 1 \), we use the estimates of Theorem 7 which also follows step by step the above estimates. This completes the proof of theorem.

**Corollary 2.** If we take \( h(\alpha) = a \) in inequality (41), we get the following inequality:

\[
\left| \frac{\psi(a_1) + \psi(b_1) + 2(1 - \sigma)}{\sigma(b_1 - a_1)} \psi(k) - \frac{B(\sigma)}{\sigma(b_1 - a_1)} \left[ \int_0^{\psi} \left( \begin{array}{c} \text{CF}_{\sigma} \psi \end{array} \right)(k) \right] + \left( \text{CF}_{\sigma} \psi \right)(k) \right| ≤ \frac{b_1 - a_1}{2} \left( \int_0^1 \left( |\psi'(a_1)|^q + 3|\psi'(b_1)|^q \right) \, d\alpha \right)^{1/q}
\]

(48)
Remark 8. Inequality (46) gives better results than inequality (39), and we have the following inequality:

\[
\frac{b_1 - a_1}{2} \left( \frac{1}{4} \right)^{1 - \frac{1}{(1/q)}} \times \left[ \left| \phi'(b_1) \right|^q \frac{1}{4} + \left| \phi'(a_1) \right|^q \frac{1}{4} \right] \left( 1 - \alpha \right) \left| 1 - 2\alpha h(\alpha) \right| d\alpha \right]
\]

(49)

Proof. Using concavity of \( \phi \): \([0, \infty) \rightarrow \mathbb{R}, \psi(x) = x^\lambda, 0 < \lambda \leq 1 \), we get

\[
\frac{b_1 - a_1}{2} \left( \frac{1}{4} \right)^{1 - \frac{1}{(1/q)}} \times \left[ \left| \phi'(b_1) \right|^q \frac{1}{4} + \left| \phi'(a_1) \right|^q \frac{1}{4} \right] \left( 1 - \alpha \right) \left| 1 - 2\alpha h(\alpha) \right| d\alpha \right]
\]

(50)

which completes the proof.

\[\square\]

4. Application to Means

For two positive numbers \( a_1 > 0 \) and \( b_1 > 0 \), define

\[
A(a_1, b_1) = \frac{a_1 + b_1}{2},
\]

\[
L_p = L_p(a_1, b_1) = \begin{cases} \frac{b_1^{p+1} - a_1^{p+1}}{(p+1)(b_1 - a_1)} & \text{if } a_1 \neq b_1, p \in \mathbb{R}, \{ -1, 0 \}, \\ a_1, & a_1 = b_2. \end{cases}
\]

(51)

These means are, respectively, called the arithmetic and \( p \)-logarithmic means of two positive numbers \( a_1 \) and \( b_1 \).

Proposition 1. Let \( a_1, b_1 \in [0, \infty) \) with \( a_1 < b_1 \), then the following inequality holds:

\[
\left| A^n(a_1, b_1) - L^n_p(a_1, b_1) \right| \leq \frac{n(b_1 - a_1)}{2} \left[ \frac{b_1^{n-1} - a_1^{n-1}}{2} + \left| a_1^{n-1} - b_1^{n-1} \right| \right] \int_0^1 \left| 1 - 2\alpha h(\alpha) \right| d\alpha .
\]

(52)
**Proof.** In Theorem 7, if we set $\psi(x) = x^n$, where $n$ is an even number with $\sigma = 1$ and $B(\sigma) = B(1) = 1$, we obtain the required result. $\square$

**Proposition 2.** Let $a_1, b_1 \in [0, \infty)$ with $a_1 < b_1$, then the following inequality holds:

$$\left| A^2(a_1, b_1) - L^2(a_1, b_1) \right| \leq \frac{(b_1 - a_1)}{2} \left[ b_1^2 + 2 \left[ a_1^2 - |b_1|^2 \right] \int_0^1 \left| 1 - 2\sigma \Delta t \right| \, d\sigma \right].$$

5. Conclusion

Hermite–Hadamard-type inequalities for modified $h$-convex functions via Caputo–Fabrizio integral operator are derived. Some new and interesting integral inequalities involving Caputo–Fabrizio fractional integral operator are also obtained for modified $h$-convex functions. Many existing results in literature become the particular cases for these results as mentioned in remarks.
