Sparse matrices appear frequently in mathematical models. In this paper, we firstly present a general expression for the entries of the \( r \)th \((r \in \mathbb{N})\) power of a certain \( n \)-square sparse matrix, in terms of the Chebyshev polynomials of the second kind. Secondly, we present a method for integer positive powers of the skew matrix corresponding to these sparse matrices. This method will be inspiring to calculate the positive integer powers of the similar matrices. Finally, we present some examples to illustrate our results. Also, we give maple 18 procedures in order to verify our calculations.

1. Introduction

In order to solve some difference equations, differential equations, and delay differential equations, we meet the necessity to compute the arbitrary positive integer powers of the square matrix [1–5]. Many papers discuss this topic [6–19]. In this paper, we obtain the entries of positive integer powers of a \( n \)-square certain sparse matrix of the order \( n = 4p + 3(p \in \mathbb{N}) \) of the following form:

\[
A = \begin{bmatrix}
0 & 0 & 2 & 0 & 0 \\
0 & 0 & -1 & -1 & 0 \\
-1 & 0 & 1 & 0 & 0 \\
1 & 0 & 1 & -1 & 0 \\
0 & -1 & 0 & -1 & 0 \\
2 & 0 & 0 & 0 & 0 \\
\end{bmatrix}
\]

We compute the \( r \)th power \((r \in \mathbb{N})\) of the matrix and the skew matrix corresponding to it, by using the expression \( A^r = TJ^rT^{-1} \) [14], where \( J \) is Jordan’s form of the matrix \( A \), and \( T \) is the transforming matrix \( A \). Although these types of matrices may have applications, we investigate these matrices purely from a mathematical point of view. In this article, interesting formulas are presented that will be attractive for math enthusiasts. Now, we are beginning with the following definition.

Definition 1 (see [15]). The Chebyshev polynomial \( U_n(x) \) of the second kind is a polynomial of degree \( n \) in \( x \) defined by

\[
U_n(x) = \frac{\sin((n+1)\theta)}{\sin \theta}, \quad \text{when } x = \cos \theta, \; n = 0, 1, 2, \ldots \tag{1}
\]

With the definition above, we find that \( U_n(x) \) satisfies the recurrence relation

\[
U_n(x) = 2xU_{n-1}(x) - U_{n-2}(x), \; U_0(x) = 1, \quad U_1(x) = 2x, \quad n = 2, 3, \ldots \tag{2}
\]
2. Eigenvalues and Jordan’s Form of Matrix $A$

In this section, we calculate the eigenvalues of matrix $A$ which are given in (1). The following lemma helps us to calculate the eigenvalues of tridiagonal matrices.

Lemma 1 (see [16]). Let $\{H(n), \ n = 1, 2, \ldots\}$ be a sequence of tridiagonal matrices of the following form:

$$H(n) = \begin{bmatrix}
h_{11} & h_{12} &  &  \\
h_{21} & h_{22} & h_{23} &  \\
 & h_{32} & h_{33} & h_{34} \\
 &  & \ddots & \ddots \\
 &  &  & h_{n-2n-1} \\
 &  &  &  & h_{n-1n-2} \\
 &  &  &  & h_{n-1n-1} \\
 &  &  &  & h_{n-1n} \\
0 & & \cdots & & h_{n-1n} \\
0 & & \cdots & & h_{nn} \\
\end{bmatrix}. \quad (4)$$

Then, the successive determinants of $H(n)$ are given by the following recursive formula:

$$|H(1)| = h_{11},$$
$$|H(2)| = h_{11}h_{22} - h_{12}h_{21},$$
$$|H(n)| = h_{nn}|H(n-1)| - h_{n-1n}h_{n-1}|H(n-2)|. \quad (5)$$

Let $\{H^*(n), \ n = 1, 2, \ldots\}$ be a sequence of the tridiagonal matrix of the following form:

$$H^*(n) = \begin{bmatrix}
h_{11} & -h_{12} &  &  \\
-h_{21} & h_{22} & -h_{23} &  \\
 & -h_{32} & h_{33} & h_{34} \\
 &  & \ddots & \ddots \\
 &  &  & h_{n-2n-1} \\
 &  &  &  & (-1)^{p^2}h_{n-1n-2} \\
 &  &  &  & (-1)^{q^2}h_{n-1n-1} \\
 &  &  &  & (-1)^{q^2}h_{n-1n} \\
0 & & \cdots & & h_{n-1n} \\
0 & & \cdots & & h_{nn} \\
\end{bmatrix}, \quad (6)$$

where $(p \text{ and } q = 1, 2, 3, \ldots)$. Since the matrices $H(n)$ and $H^*(n)$ have the same recursive formula, it can be written as follows:

$$|H(n)| = |H^*(n)|. \quad (7)$$

Theorem 1. The eigenvalues of $A$, as given in (4), are as follows:

$$\lambda_k = -2 \cos \left(\frac{(k-1)\pi}{n-1}\right), \quad k = 1, 2, \ldots, n. \quad (8)$$
Proof. Let
\[ D_n(x) = \begin{bmatrix}
    x & 0 & & & & \\
    0 & x & -1 & & & \\
    -1 & x & -1 & & & \\
    -1 & x & 1 & 0 & & \\
    1 & x & 1 & & & \\
    1 & x & -1 & & & \\
    -1 & x & -1 & & & \\
    1 & x & -1 & & & \\
    & & & & & \\
    1 & x & 1 & & & \\
    0 & x & 1 & & & \\
\end{bmatrix}, \]
\[ \Delta_n(x) = \begin{bmatrix}
    x & 1 & & & & \\
    1 & x & 1 & & & \\
    1 & x & 1 & & & \\
    1 & x & 1 & & & \\
    0 & x & 1 & & & \\
    0 & 0 & x & & & \\
    0 & 0 & 0 & x & & \\
    0 & 0 & 0 & 0 & x & \\
    0 & 0 & 0 & 0 & 0 & x \\
\end{bmatrix}. \]

If we calculate the determinant given in (9) by using the Laplace expansion, then we have
\[ D_n(x) = (x^2 - 4) \Delta_{n-2}(x). \] (10)

On the other hand, from Lemma 1, we get
\[ \Delta_n(x) = x \Delta_{n-1}(x) - \Delta_{n-2}(x), n \geq 3, \Delta_1(x) = x, \Delta_2(x) = x^2 - 1. \] (11)

Solving difference equation (11), we obtain
\[ \Delta_n(x) = U_n \left( \frac{x}{2} \right), \] (12)

where \( U_n(x) \) is the \( n \) th degree Chebyshev polynomial of the second kind. From (10) and (12) follows.
\[ D_n(x) = (x^2 - 4) U_{n-2} \left( \frac{x}{2} \right), \] (13)
\[ D_n(-x) = |A - xI| = (x^2 - 4) U_{n-2} \left( -\frac{x}{2} \right). \] (14)

Hence, the eigenvalues of \( A \) are
\[ \lambda_k = -2 \cos \left( \frac{(k-1)\pi}{n-1} \right), k = 1, 2, \ldots, n. \] (15)

Since all the eigenvalues \( \lambda_k \) for \( k = 1, 2, \ldots, n \) are simple, each eigenvalue \( \lambda_k \) corresponds single Jordan cell \( J_j (\lambda_k) \) in the matrix \( J \). Taking this into account, we write down Jordan’s form of the matrix \( A \).

\[ J = \text{diag}(\lambda_1, \lambda_2, \lambda_3, \ldots, \lambda_n). \] (16)

And applying the relation \( \lambda_k = -\lambda_{n-k+1}, k = 1, 2, \ldots, (n-1)/2 \), we can write
\[ J = \text{diag}(\lambda_1, \lambda_2, \lambda_3, \ldots, 0, -\lambda_3, -\lambda_2, -\lambda_1). \]

\[ \square \]

3. General Expression for the Entries of \( A^T \)

In this section, we firstly find the transforming matrix \( T \) and its inverse for expression \( A = TJT^{-1} \) by using Chebyshev polynomial second kind. Secondly, we derive a general expression for the entries of matrix \( A^T \) for \( (r \in \mathbb{N}) \). From relation, \( A = TJT^{-1} \) follows
\[ AT = TJ, \] (17)
where \( T = [T_1, T_2, \ldots, T_n] \) and \( T_i = [T_{i1}, T_{i2}, \ldots, T_{in}]^t \), for, \( i = 1, 2, \ldots, n \); then, we can write
\[ A[T_1, T_2, T_3, \ldots, T_n] = [T_1, T_2, T_3, \ldots, T_n] \cdot \text{diag}(\lambda_1, \lambda_2, \lambda_3, \ldots, \lambda_n). \] (18)

Now, we have
\[ AT_i = \lambda_i T_i, \quad i = 1, 2, 3, \ldots, n. \] (19)

From (19) follows.
\[
\begin{bmatrix}
    2T_{ni} & \cdots & \lambda_i T_{ni} \\
    \vdots & \ddots & \vdots \\
    \lambda_i T_{ni} & \cdots & \lambda_i T_{ni}
\end{bmatrix}, \quad i = 1, 2, 3, \ldots, n. \] (20)

Solving the set of systems (20), we find the eigenvectors of the matrix \( A \).
arbitrarily, we write down the transforming matrix

\[ T_i = \begin{bmatrix} \alpha & 0 & 0 & 0 & 0 & \ldots & 0 \\ -\alpha & c_\alpha U_\alpha(\frac{\beta}{2}) & c_\beta U_\beta(\frac{\lambda}{2}) & 0 & 0 & \ldots & 0 \\ 0 & 0 & c_\alpha U_\alpha(\frac{\beta}{2}) & c_\beta U_\beta(\frac{\lambda}{2}) & 0 & \ldots & 0 \\ 0 & 0 & 0 & c_\alpha U_\alpha(\frac{\beta}{2}) & c_\beta U_\beta(\frac{\lambda}{2}) & \ldots & 0 \\ 0 & 0 & 0 & 0 & c_\alpha U_\alpha(\frac{\beta}{2}) & \ldots & 0 \\ & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & 0 & \ddots & c_\alpha U_\alpha(\frac{\beta}{2}) \\ 0 & 0 & 0 & 0 & 0 & \ldots & c_\alpha U_\alpha(\frac{\beta}{2}) \end{bmatrix} \]

where $U_k(x)$ is the $k$th degree Chebyshev polynomial of the second kind, $\alpha$ and $\beta$ are arbitrary numbers, and

\[ c_i = \begin{cases} -1, & i \in X = \{4p - 3 | p = 1, 2, \ldots\} \\ 1, & \text{if } i \in \mathbb{N} \cup \{0\} \setminus X. \end{cases} \]

Taking into account (21) and (22) and choosing $\alpha = \beta = 1$ arbitrarily, we write down the transforming matrix $T$:

\[ T = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & \ldots & 0 \\ 0 & U_\alpha(\frac{\lambda}{2}) & U_\alpha(\frac{\lambda}{2}) & U_\alpha(\frac{\lambda}{2}) & 0 & \ldots & 0 \\ 0 & -U_\alpha(\frac{\lambda}{2}) & -U_\alpha(\frac{\lambda}{2}) & -U_\alpha(\frac{\lambda}{2}) & 0 & \ldots & 0 \\ 0 & U_\alpha(\frac{\lambda}{2}) & U_\alpha(\frac{\lambda}{2}) & U_\alpha(\frac{\lambda}{2}) & 0 & \ldots & 0 \\ 0 & -U_\alpha(\frac{\lambda}{2}) & -U_\alpha(\frac{\lambda}{2}) & -U_\alpha(\frac{\lambda}{2}) & 0 & \ldots & 0 \\ 0 & U_\alpha(\frac{\lambda}{2}) & U_\alpha(\frac{\lambda}{2}) & U_\alpha(\frac{\lambda}{2}) & 0 & \ldots & 0 \\ 0 & -U_\alpha(\frac{\lambda}{2}) & -U_\alpha(\frac{\lambda}{2}) & -U_\alpha(\frac{\lambda}{2}) & 0 & \ldots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & 0 & \ldots & 1 \end{bmatrix} \]

Denoting $j$th column of the inverse matrix $T^{-1}$ by $\tau_j(T^{-1} = (\tau_1, \tau_2, \tau_3, \ldots, \tau_n))$, here,

\[ \tau_j = [\tau_{ij}, \tau_{ij}, \tau_{ij}, \ldots, \tau_{ij}]^T, \quad j = 1, 2, \ldots, n. \] (24)

Then, we can write

\[ [\tau_1, \tau_2, \tau_3, \ldots, \tau_{n-1}, \tau_n] A = [\tau_1, \tau_2, \tau_3, \ldots, \tau_{n-1}, \tau_n]. \] (25)

From (25), follows.

\[ [2\tau_{n-3}, -\tau_3 - \tau_4, -\tau_3 + \tau_5 + \tau_4 + \tau_5, \ldots, \tau_{n-2}, 2\tau_1] = [J\tau_1, J\tau_2, \ldots, J\tau_{n-1}, J\tau_n]. \] (26)
Let \( \tau_{i2} = m_i \) for \( i = 1, 2, 3, \ldots, n \), then from solving the set of systems (26), we can conclude \( \tau_{11} = -\tau_{1i} = \tau_{i1} = \tau_{mi} = \rho \) which \( \rho \) is an arbitrary number, \( \tau_{11} = \tau_{mi} = 0 \) for \( i = 2, 3, \ldots, n - 1 \). Also, we can conclude \( \tau_{1i} = \tau_{mi} = 0 \) for \( i = 2, 3, \ldots, n - 1 \), \( \tau_{ij} = \tau_{nj} = 0 \) for \( j = 2, 3, \ldots, n - 1 \), and other elements of the matrix \( T^{-1} \) are equal \( m_{ij} \) (Chebyshev polynomials second kind in eigenvalues matrix \( A \)). So we can write the columns matrix \( T^{-1} \) as follows:

\[
\begin{bmatrix}
\rho \\
0 \\
0 \\
\vdots \\
0 \\
\rho \\
\end{bmatrix}
\begin{bmatrix}
0 \\
m_2U_{j1}(\frac{\lambda_2}{2}) \\
m_2U_{j2}(\frac{\lambda_2}{2}) \\
\vdots \\
m_nU_{j1}(\frac{\lambda_n}{2}) \\
m_nU_{j2}(\frac{\lambda_n}{2}) \\
0 \\
\end{bmatrix},
\]

\[j = 2, 3, \ldots n - 1,\]

where

\[
d_j = \begin{cases} 
-1 & \text{if } j \in \mathbb{N} - 4p - 3 | p = 1, 2, \ldots \\
1 & \text{if } j \in \mathbb{N} \cup \{0\} - X.
\end{cases}
\]

Taking into account (27) and (28), we can write down the matrix \( T^{-1} \):

\[
T^{-1} = \begin{bmatrix}
\rho & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \ldots & -\rho \\
0 & m_2U_1(\frac{\lambda_2}{2}) & -m_1U_1(\frac{\lambda_1}{2}) & m_3U_1(\frac{\lambda_3}{2}) & m_4U_1(\frac{\lambda_4}{2}) & m_1U_2(\frac{\lambda_1}{2}) & \ldots \\
0 & m_2U_2(\frac{\lambda_2}{2}) & -m_1U_2(\frac{\lambda_1}{2}) & m_3U_2(\frac{\lambda_3}{2}) & m_4U_2(\frac{\lambda_4}{2}) & m_1U_3(\frac{\lambda_1}{2}) & \ldots \\
0 & m_2U_3(\frac{\lambda_2}{2}) & -m_1U_3(\frac{\lambda_1}{2}) & m_3U_3(\frac{\lambda_3}{2}) & m_4U_3(\frac{\lambda_4}{2}) & m_1U_4(\frac{\lambda_1}{2}) & \ldots \\
0 & \vdots & \vdots & \vdots & \vdots & \vdots & \ddots \\
0 & m_nU_1(\frac{\lambda_n}{2}) & -m_{n-1}U_1(\frac{\lambda_{n-1}}{2}) & \ldots & m_1U_n(\frac{\lambda_1}{2}) & m_1U_{n-1}(\frac{\lambda_1}{2}) & \ldots
\end{bmatrix},
\]
From $T^{-1}T = I$, we have
\[ \rho + \rho = 1 \Rightarrow \rho = \frac{1}{2} \] (30)

And, for $i = 2, 3, \ldots, n - 1$,
\[
\begin{align*}
\Rightarrow m_{i} \sum_{j=0}^{n-3} U_{j}^{2} \left( \frac{\lambda_{j}}{2} \right) &= 1 \\
\Rightarrow m_{i} \sum_{j=0}^{n-3} U_{j}^{2} \left( -\cos \frac{(i-1)n}{n-1} \right) &= 1 \\
\Rightarrow m_{i} \sum_{j=0}^{n-3} U_{j}^{2} \left( \cos \frac{(n-i)n}{n-1} \right) &= 1 \\
\Rightarrow m_{i} \sum_{j=0}^{n-3} \left[ \frac{\sin ((j+1)((n-i)/(n-1))\pi)}{\sin ((n-i)/(n-1))\pi} \right]^{2} &= 1 \\
\Rightarrow m_{i} \sum_{j=1}^{n-2} \left[ \frac{\sin j((i-1)/(n-1))\pi}{\sin ((i-1)/(n-1))\pi} \right]^{2} &= 1 \\
\Rightarrow m_{i} \frac{\sin^{2} ((i-1)/(n-1))\pi}{\sin^{2} ((i-1)/(n-1))\pi} \sum_{j=1}^{n-2} \sin^{2} \left( \frac{j(i-1)n}{n-1} \right) &= 1 \\
\Rightarrow m_{i} \frac{1}{2 \sin^{2} ((i-1)/(n-1))\pi} \sum_{j=1}^{n-2} \left( 1 - \cos \frac{2j(i-1)n}{n-1} \right) &= 1 \\
\Rightarrow m_{i} \frac{1}{2 \sin^{2} ((i-1)/(n-1))\pi} \left[ (n-2) - \sum_{j=1}^{n-2} \cos \frac{2j(i-1)n}{n-1} \right] &= 1 \\
\Rightarrow m_{i} \frac{\frac{n-3}{2} + \frac{\sin ((i-1)/(n-1))\pi}{2 \sin ((i-1)/(n-1))\pi}}{1} &= 1 \left( \sum_{j=1}^{N} \cos j\theta = \frac{1}{2} + \frac{\sin (N+1/2)\theta}{2 \sin (\theta/2)} \right) \\
\Rightarrow m_{i} \frac{(n-1)}{2 \sin^{2} ((i-1)/(n-1))\pi} &= 1 \\
\Rightarrow m_{i} = \frac{2 \sin^{2} ((i-1)/(n-1))\pi}{n-1}.
\end{align*}
\]
Therefore,

\[
m_i = \frac{4 - \lambda_i^2}{2(n-1)} \quad i = 2, \ldots, n-1.
\]  

(32)

\[
T^{-1} = \frac{1}{2(n-1)} \begin{bmatrix}
(n-1) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \ldots & -(n-1) \\
0 & (4 - \lambda_1^2)U_0\left(\frac{\lambda_2}{2}\right) & -(4 - \lambda_2^2)U_1\left(\frac{\lambda_2}{2}\right) & + & + & - & (4 - \lambda_3^2)U_3\left(\frac{\lambda_3}{2}\right) & + & + & \ldots & 0 \\
0 & (4 - \lambda_1^2)U_0\left(\frac{\lambda_2}{2}\right) & -(4 - \lambda_2^2)U_1\left(\frac{\lambda_2}{2}\right) & + & + & - & (4 - \lambda_3^2)U_3\left(\frac{\lambda_3}{2}\right) & + & + & \ldots & 0 \\
0 & (4 - \lambda_1^2)U_0\left(\frac{\lambda_2}{2}\right) & -(4 - \lambda_2^2)U_1\left(\frac{\lambda_2}{2}\right) & + & + & - & (4 - \lambda_3^2)U_3\left(\frac{\lambda_3}{2}\right) & + & + & \ldots & 0 \\
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\
0 & (4 - \lambda_{n-1}^2)U_0\left(\frac{\lambda_n}{2}\right) & -(4 - \lambda_n^2)U_1\left(\frac{\lambda_n}{2}\right) & + & + & - & (4 - \lambda_1^2)U_n\left(\frac{\lambda_1}{2}\right) & + & + & - & 0 \\
(n-1) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \ldots & -(n-1)
\end{bmatrix}
\]  

(33)

By combining (15), (23), (32) and using the equality \( A' = T'J'T^{-1} \), we compute the \( r \) th powers of the matrix \( A \). Therefore, \((i, j)\) th entry of matrix \( A' \) can be given as follows:

\[
\begin{align*}
[A']_{ij} &= [T'J'T^{-1}]_{ij} = \frac{1}{2(n-1)} \times \\
&= \begin{cases} 
(n-1) \left[ \frac{1}{i} \right] (\lambda_i + \lambda_j) & \text{if } i = 1, j = 1, 2, \ldots, n-1 \\
(n-1) \left[ \frac{i}{n} \right] (-\lambda_i + \lambda_j) & \text{if } j = 1, i = 2, 3, \ldots, n \\
\sum_{k=2}^{n-1} c_{i-j}d_{j-k} \lambda_k (4 - \lambda_k^2)U_{i-k}\left(\frac{\lambda_k}{2}\right)U_{j-k}\left(\frac{\lambda_k}{2}\right) & \text{if } i, j = 2, 3, \ldots, n-1 \\
(n-1) \left[ \frac{1}{i} \right] (-\lambda_i + \lambda_j) & \text{if } j = n, i = 1, 2, \ldots, n-1 \\
(n-1) \left[ \frac{j}{n} \right] (\lambda_i + \lambda_j) & \text{if } i = n, j = 2, 3, \ldots, n \\
\end{cases}
\end{align*}
\]  

(34)

For any real number \( x \), \( \lfloor x \rfloor \) is the largest integer that is less than or equal to \( x \).
In the continuation of this article, we calculate the positive integer powers of the skew matrices corresponding to matrix (1) as follows:

\[
B = \begin{bmatrix}
2 & 0 & 0 \\
-1 & 0 & 0 \\
-1 & 0 & 1 \\
0 & 1 & 0 \\
-1 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 2 \\
0 & 0 & 0 \\
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1 \\
0 & 0 & 1 \\
\end{bmatrix}
\]

State 1. If \( n = 4m + 1 \), \( m = 1, 2, \ldots \), then

\[
B^r = \begin{cases}
A^r, & \text{for } r = 2k, \\
JA^r, & \text{for } r = 2k + 1.
\end{cases}
\]

State 2. If \( n = 4m + 3 \), \( m = 1, 2, \ldots \), then

\[
B^r = \begin{cases}
2^r, & \text{for } r = 4k - 2, \\
-[A^r], & \text{for } r = 4k - 1, \\
2^r, & \text{for } r = 4k, \\
JA^r, & \text{for } r = 4k + 1.
\end{cases}
\]

Proof. We prove this theorem by induction on \( k \).

State 3. The base case of \( k = 1 \) is true, because, with simple calculations, we have

\[
B^2 = A^2, B^3 = JA^3.
\]

We suppose that the result is true for \( k > 1 \) and consider case \( k + 1 \).

By the induction hypothesis, we have

\[
B^{2k} = A^{2k}, B^{2k+1} = JA^{2k+1}.
\]

We also show that the case \( k + 1 \) is true

\[
B^{2k+2} = B^{2k}B^2 = A^{2k}A^2 = A^{2k+2}, \\
B^{2k+3} = B^{2k+1}B^2 = JA^{2k+1}A^2 = JA^{2k+3}.
\]

State 4. The case \( k = 1 \) is true, and after the necessary calculations, we have

\[
B^2 = \begin{bmatrix} 2^2 & 0 \\ 0 & 2^2 \end{bmatrix}, B^3 = JA^3, B^4 = A^4, B^5 = \begin{bmatrix} 2^5 & 0 \\ 0 & 2^5 \end{bmatrix}.
\]

We suppose that the result is true for \( k > 1 \) and show that case \( k + 1 \) is true.

By the induction hypothesis, we have

\[
B^{4k-2} = \begin{bmatrix} 2^{4k-2} & 0 \\ 0 & 2^{4k-2} \end{bmatrix}, B^{4k-1} = JA^{4k-1}, B^{4k} = \begin{bmatrix} 2^{4k} & 0 \\ 0 & 2^{4k} \end{bmatrix}
\]

We also show that case \( k + 1 \) is true.
\[ B^{4k+2} = B^{4k-2}B^4 = \begin{bmatrix} 2^{4k-2} & \lambda_1^{-1} & \lambda_2^{-1} \end{bmatrix} \begin{bmatrix} 2^2 \\ -[A^{4k-2}] \\ 2^2 \end{bmatrix} \]
\[ = \begin{bmatrix} 2^{4k-2} \\ -[A^{4k-2}] \\ 2^{4k-2} \end{bmatrix} \begin{bmatrix} \lambda_1^2 \\ [A^4] \\ \lambda_2^2 \end{bmatrix} \]
\[ = \begin{bmatrix} 2^{4k+2} \\ -[A^{4k+2}] \\ 2^{4k+2} \end{bmatrix}, \]
\[ B^{4k+3} = B^{4k-1}B^4 = JA^{4k-3}B^4, B^{4k+4} = B^{4k+1}B^4 = A^{4k}A^4 = A^{4k+4} \tag{47} \]
\[ B^{4k+5} = B^{4k+1}B^4 = \begin{bmatrix} 2^{4k+1} \\ -[JA^{4k+1}] \\ 2^{4k+1} \end{bmatrix} \begin{bmatrix} 2^2 \\ -[A^2] \\ 2^2 \end{bmatrix} \]
\[ = \begin{bmatrix} 2^{4k+1} \\ -[A^{4k+1}] \\ 2^{4k+1} \end{bmatrix} \begin{bmatrix} \lambda_1^2 \\ [A^4] \\ \lambda_2^2 \end{bmatrix} \]
\[ = \begin{bmatrix} 2^{4k+5} \\ -[A^{4k+5}] \\ 2^{4k+5} \end{bmatrix}. \]

Thus, the formulas also hold for \( k + 1 \), and the induction arguments are completed.

We can compute \((i, j)\)th entry of matrix \( B^r \) in (35) by using formula (34) and Theorem 2.

4. Numerical Consideration

In this section, we give an example that calculates the powers matrix (1). Calculations given in this section can be verified by the Maple 18 procedure that is given in Appendix.

Example 1. If \( n = 7 \), then let \( A_1 \) be a \( 7 \times 7 \) matrix, given in (1) as in the following:

\[
A_1 = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 2 \\ 0 & 0 & -1 & 0 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 1 & 0 \\ 2 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}. \tag{48}
\]

2\(rd\), 3\(rd\), and 4\(rd\) powers of the matrix \( A_1 \) are computed as in the following.

From (15), the eigenvalues of the matrix \( A_1 \) can be written for \( k = 1, 2, \ldots, 7 \) as follows:

\[ \lambda_k = -2 \cos(k-1)\pi/n - 1 \text{, namely, } \lambda_1 = -2, \lambda_2 = -\sqrt{3} \]
\[ , \lambda_3 = -1, \lambda_4 = 0, \lambda_5 = 1, \lambda_6 = \sqrt{3}, \text{ and } \lambda_7 = 2. \]

From (23) and (32), we can write the transforming matrix \( T \) and its inverse as follows:
\[ T = \begin{bmatrix}
0 & U_0(\frac{\lambda_2}{2}) & U_0(\frac{\lambda_3}{2}) & U_0(\frac{\lambda_4}{2}) & U_0(\frac{\lambda_5}{2}) & U_0(\frac{\lambda_6}{2}) & 0 \\
0 & -U_1(\frac{\lambda_2}{2}) & -U_1(\frac{\lambda_3}{2}) & -U_1(\frac{\lambda_4}{2}) & -U_1(\frac{\lambda_5}{2}) & -U_1(\frac{\lambda_6}{2}) & 0 \\
0 & U_2(\frac{\lambda_2}{2}) & U_2(\frac{\lambda_3}{2}) & U_2(\frac{\lambda_4}{2}) & U_2(\frac{\lambda_5}{2}) & U_2(\frac{\lambda_6}{2}) & 0 \\
0 & U_3(\frac{\lambda_2}{2}) & U_3(\frac{\lambda_3}{2}) & U_3(\frac{\lambda_4}{2}) & U_3(\frac{\lambda_5}{2}) & U_3(\frac{\lambda_6}{2}) & 0 \\
-1 & U_4(\frac{\lambda_2}{2}) & U_4(\frac{\lambda_3}{2}) & U_4(\frac{\lambda_4}{2}) & U_4(\frac{\lambda_5}{2}) & U_4(\frac{\lambda_6}{2}) & 0 \\
\end{bmatrix} \]

\[ T^{-1} = \frac{1}{2(7-1)} \begin{bmatrix}
(7-1) & 0 & 0 & 0 & 0 & 0 & -(7-1) \\
0 & (4 - \lambda_2^2)U_0(\frac{\lambda_2}{2}) & -(4 - \lambda_3^2)U_1(\frac{\lambda_3}{2}) & (4 - \lambda_4^2)U_2(\frac{\lambda_4}{2}) & (4 - \lambda_5^2)U_3(\frac{\lambda_5}{2}) & (4 - \lambda_6^2)U_4(\frac{\lambda_6}{2}) & 0 \\
0 & (4 - \lambda_2^2)U_0(\frac{\lambda_2}{2}) & -(4 - \lambda_3^2)U_1(\frac{\lambda_3}{2}) & (4 - \lambda_4^2)U_2(\frac{\lambda_4}{2}) & (4 - \lambda_5^2)U_3(\frac{\lambda_5}{2}) & (4 - \lambda_6^2)U_4(\frac{\lambda_6}{2}) & 0 \\
0 & (4 - \lambda_2^2)U_0(\frac{\lambda_2}{2}) & -(4 - \lambda_3^2)U_1(\frac{\lambda_3}{2}) & (4 - \lambda_4^2)U_2(\frac{\lambda_4}{2}) & (4 - \lambda_5^2)U_3(\frac{\lambda_5}{2}) & (4 - \lambda_6^2)U_4(\frac{\lambda_6}{2}) & 0 \\
0 & (4 - \lambda_2^2)U_0(\frac{\lambda_2}{2}) & -(4 - \lambda_3^2)U_1(\frac{\lambda_3}{2}) & (4 - \lambda_4^2)U_2(\frac{\lambda_4}{2}) & (4 - \lambda_5^2)U_3(\frac{\lambda_5}{2}) & (4 - \lambda_6^2)U_4(\frac{\lambda_6}{2}) & 0 \\
0 & (4 - \lambda_2^2)U_0(\frac{\lambda_2}{2}) & -(4 - \lambda_3^2)U_1(\frac{\lambda_3}{2}) & (4 - \lambda_4^2)U_2(\frac{\lambda_4}{2}) & (4 - \lambda_5^2)U_3(\frac{\lambda_5}{2}) & (4 - \lambda_6^2)U_4(\frac{\lambda_6}{2}) & 0 \\
(7-1) & 0 & 0 & 0 & 0 & 0 & (7-1) \\
\end{bmatrix} \]
Then, we get

\[
\begin{bmatrix}
\frac{1}{2} & 0 & 0 & 0 & 0 & 0 & -\frac{1}{2} \\
0 & \frac{\sqrt{3}}{12} & \frac{1}{6} & 0 & \frac{-\sqrt{3}}{12} & 0 & 0 \\
0 & \frac{1}{4} & 0 & \frac{1}{4} & 0 & \frac{1}{4} & 0 \\
0 & \frac{1}{3} & 0 & -\frac{1}{3} & 0 & \frac{1}{3} & 0 \\
0 & \frac{1}{4} & 0 & -\frac{1}{4} & 0 & \frac{1}{4} & 0 \\
0 & \frac{\sqrt{3}}{12} & 0 & \frac{\sqrt{3}}{12} & 0 & \frac{1}{12} & 0 \\
\frac{1}{2} & 0 & 0 & 0 & 0 & 0 & \frac{1}{2}
\end{bmatrix}
\]

(49)

Appendix

Following Maple 18 procedure calculates the \( r \) th power of the \( n \times n \) sparse matrix (1):

\[
\text{restart:}
\text{with(ListTools):}
\text{power:= proc(n,r)}
\text{local k,lambda,i,j,c,d,u,x,A, Cell;}
\text{for k from 0 to n do}
\text{c[k]:= 1:
lambda[k]:= -2.cos((k-1) \cdot Pi/n - 1):
if irem(k,4)=1
then c[k]:= -1
end if;
d[k]:= c[k]:
u[k]:= sin((k+1) \cdot \text{arccos}(x))/sin(\text{arccos}(x)).
end if;
Cell:= [ ]:
for i from 1 to n do
for j from 1 to n do
if i=1 and member(i,seq(t, t=1 . . . (n-1))) = true then
A[r,i,j]:= 1/2 \cdot (n-1) \cdot (n-1).floor (1/j).
(lambda[1]^r + (lambda[n]^r))
end if;
if j=1 and member(i,seq(t, t=2 . . . n)) = true then
A[r,i,j]:= 1/2 \cdot (n-1) \cdot (n-1).floor (i/n).
(- (lambda[1]^r + (lambda[n]^r))
\text{end proc:}
\]

Also, \((i, j)\) th entry of the matrices \(A^2_1, A^3_1,\) and \(A^4_1\) can be verified by the formula given in (34).
