

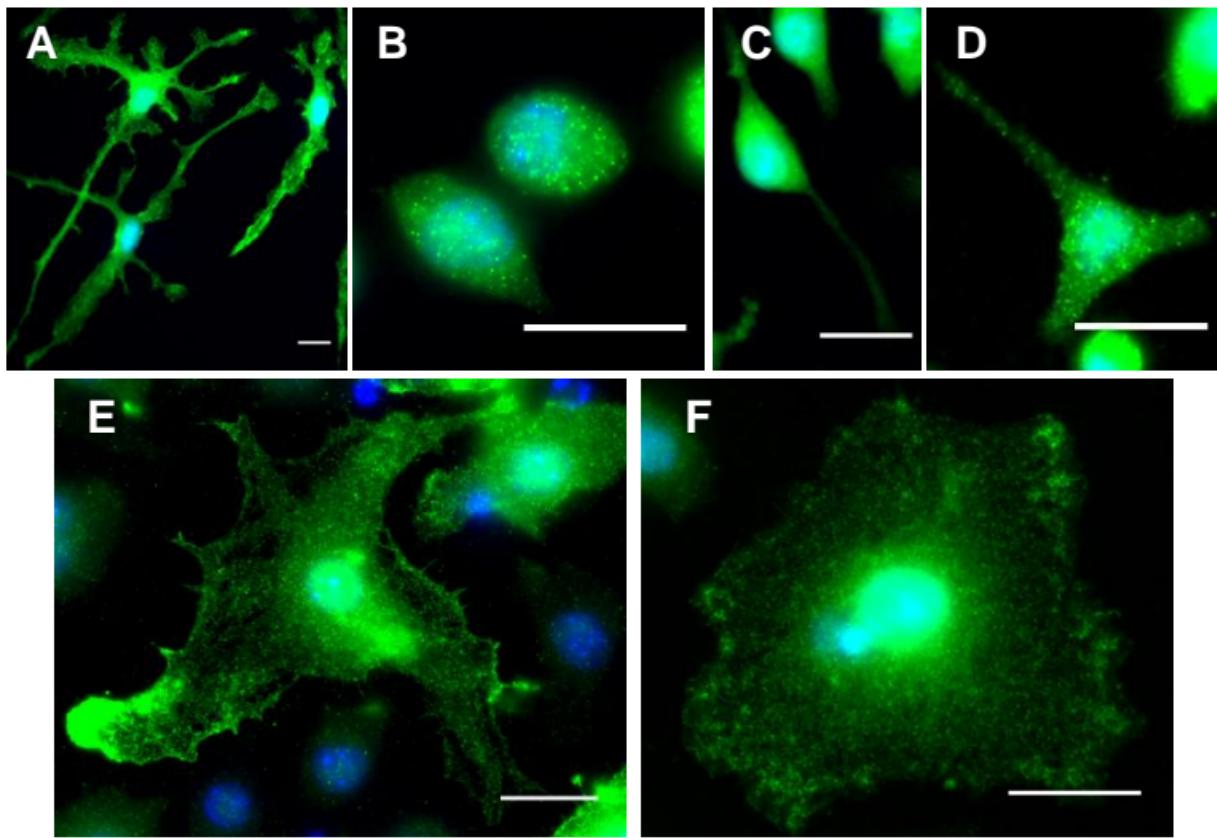

Fig. S1

■ Iba1 ■ Hoechst

Fig. S1. N9 microglial cells show lower number and length of ramifications than primary cultured microglia from mice cortical brain and a combination of distinct morphologies. Morphological analysis was performed by immunocytochemistry using anti-Iba1, as indicated in methods. Nuclei were stained with Hoechst (blue fluorescence). Primary cultures of microglia isolated from mice cortical brain were stained with Iba-1 and used for comparative purpose (A). Different morphologies observed in N9 cells included round/oval (B), ramified with two (C) or three (D) ramifications, amoeboid with thicker branches (D) and amoeboid with absent ramifications (E). Representative results of one experiment are shown and scale bar represents 20 μ m.
