

Acute toxicity of the *C. procera* methanolic extract.

To evaluate the toxicity of the extract, an acute toxicity assay was performed as described in protocol 423 by the OECD.

Pathological findings not were observed in the organs during the necropsy of mice after euthanasia

Before administration of the extract, the mice were fasted for four hours. The extract was administered through an orogastric tube at a dose of 2,000 mg/kg body weight and food was withheld for an additional 2 hours.

Mice receiving the methanolic extract of *C. procera* for 14 days did not show any signs of toxicity, nor were any pathological findings observed in the organs during the necropsy of mice after euthanasia.
