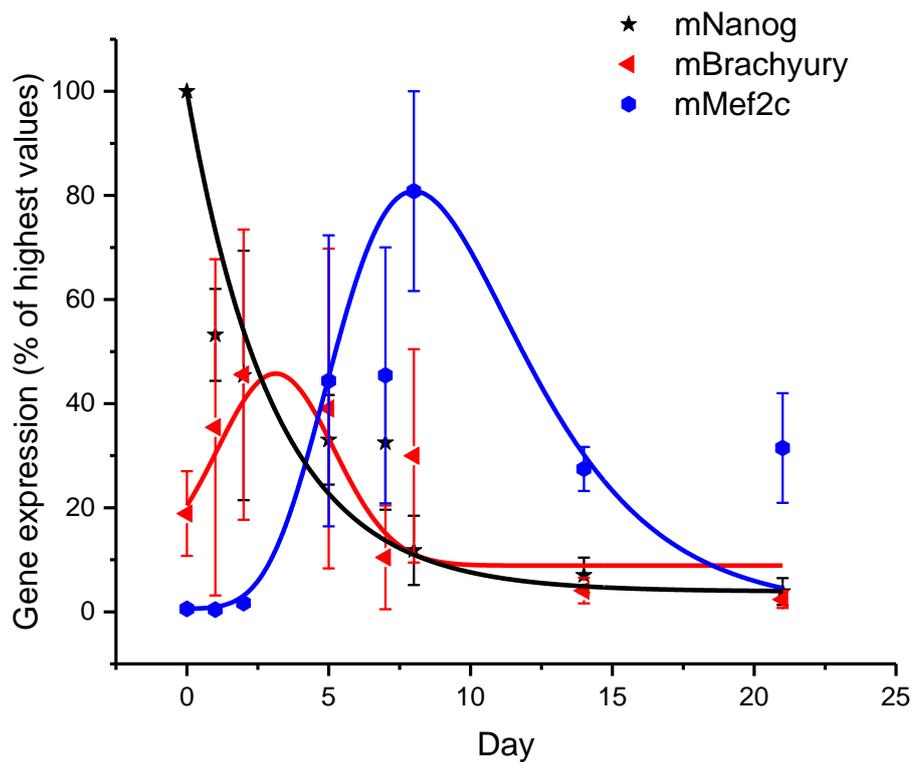

Figure 1S. Time-course of gene expression in differentiating mEBs - Relative expression of mNanog (pluripotency marker), mBrachyury (early mesodermic) and mMef2c (cardiac specific) genes. Data are the mean \pm s.e. of 3 differentiations; measures were performed in triplicate.

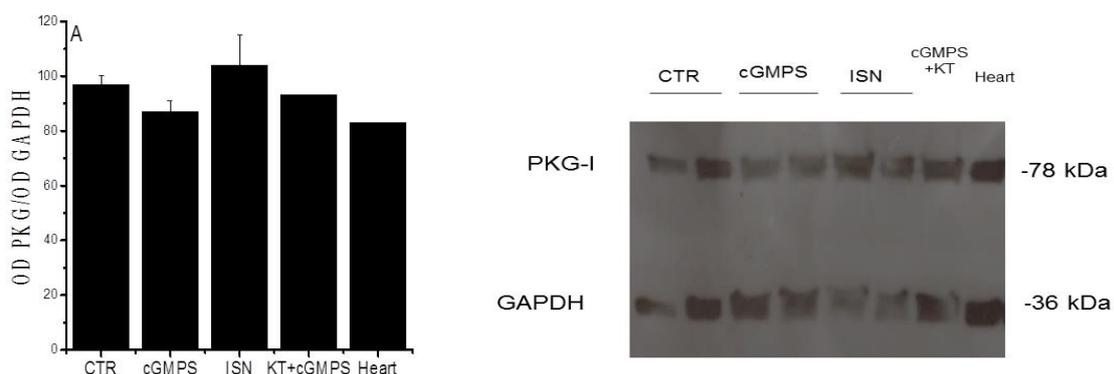

Figure 2S - PKG-I protein expression in a single experimental preparation used to quantify protein phosphorylation (see figure 4). Different drug treatments were performed as described in the method (scheme 2).

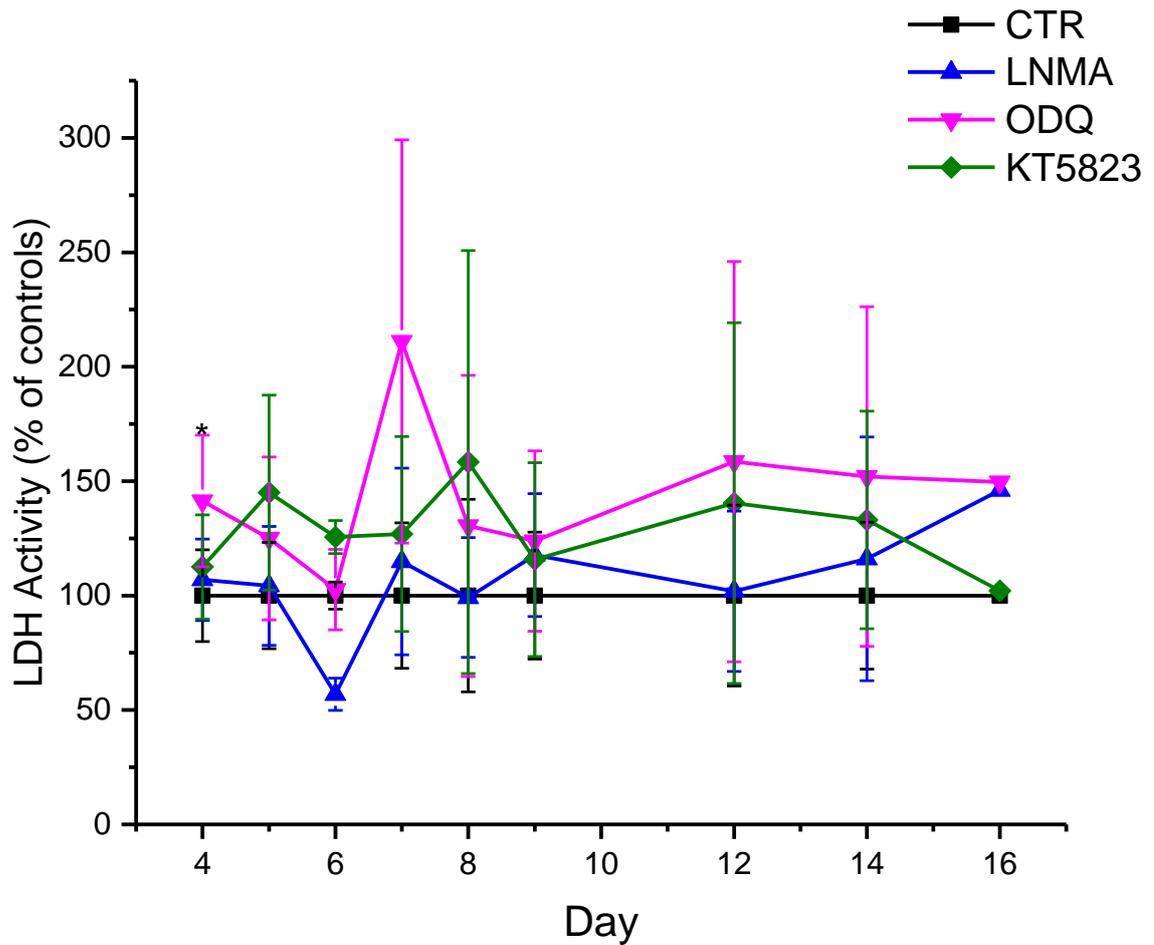

Figure 3S - LDH release during mEBs cardiac differentiation - LDH activity in conditioned medium of mEBs was measured in control conditions or in the presence of either 50 μ M ISN (NO-donor) or NOS/sGC/PKG-I pathway inhibitors (respectively, 100 μ M L-NMA, 1 μ M ODQ or 1 μ M KT5823) from day 0 to 16. Data are expressed as percentage of control values. * $P < 0.05$ vs control, one way ANOVA followed by post-hoc Bonferroni's test. Data are the mean \pm s.e. of at least 3 different differentiations; measures were performed in duplicate.
